

Troubleshooting BGP

Philip Smith <pfs@cisco.com>
NANOG 29, Chicago, October 2003

Presentation Slides

Cisco.com

Available on

ftp://ftp-eng.cisco.com/pfs/seminars/NANOG29-BGP-Troubleshooting.pdf

Assumptions

Cisco.com

Presentation assumes working knowledge of BGP

Please feel free to ask questions at any time!

Agenda

- Fundamentals of Troubleshooting
- Local Configuration Problems
- Internet Reachability Problems

Fundamentals: Problem Areas

Cisco.com

- First step is to recognise what causes the problem
- Possible Problem Areas:

Misconfiguration

Configuration errors caused by bad documentation, misunderstanding of concepts, poor communication between colleagues or departments

Human error

Typos, using wrong commands, accidents, poorly planned maintenance activities

Fundamentals: Problem Areas

Cisco.com

More Possible Problem Areas:

"feature behaviour"

Or – "it used to do this with Release X.Y(a) but Release X.Y(b) does that"

Interoperability issues

Differences in interpretation of RFC1771 and its developments

Those beyond your control

Upstream ISP or peers make a change which has an unforeseen impact on your network

Fundamentals: Working on Solutions

Cisco.com

Next step is to try and fix the problem

And this is not about diving into network and trying random commands on random routers, just to "see what difference this makes"

Before we begin/Troubleshooting is about:

Not panicking

Creating a checklist

Working to that checklist

Starting at the bottom and working up

Fundamentals: Checklists

Cisco.com

 This presentation will have references in the later stages to checklists

They are the best way to work to a solution

They are what many NOC staff follow when diagnosing and solving network problems

It may seem daft to start with simple tests when the problem looks complex

But quite often the apparently complex can be solved quite easily

Fundamentals: Tools

- Familiarise yourself with the routers tools:
 - Is logging of the BGP process enabled?
 - Are you familiar with the BGP debug process and commands (if available)
 - Check vendor documentation before switching on full BGP debugging you might get fewer surprises

Agenda

- Fundamentals
- Local Configuration Problems
- Internet Reachability Problems

Local Configuration Problems

- Peer Establishment
- Missing Routes
- Inconsistent Route Selection
- Loops and Convergence Issues

Peer Establishment: ACLs and Connectivity

Cisco.com

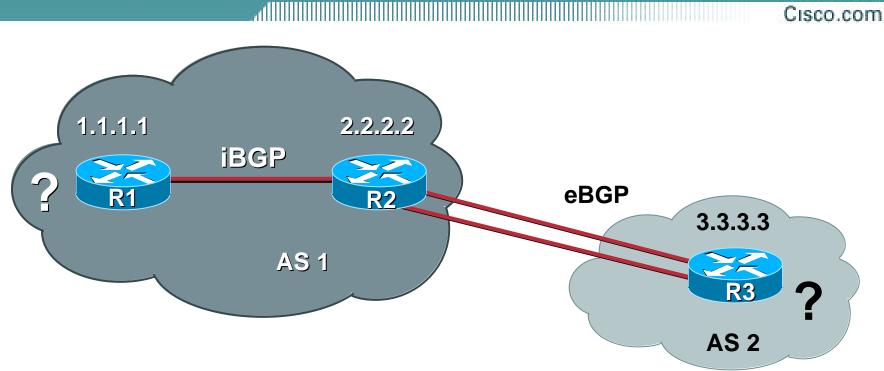

- Routers establish a TCP session
 Port 179—Permit in interface packet filters
 IP connectivity (route from IGP)
- OPEN messages are exchanged
 Peering addresses must match the TCP session

Local AS configuration parameters

Peer Establishment: Common Problems

- Sessions are not established
 No IP reachability
 Incorrect configuration
- Peers are flapping
 Layer 2 problems

Peer Establishment

- Is the Local AS configured correctly?
- Is the remote-as assigned correctly?
- Verify with your diagram or other documentation!

Peer Establishment: iBGP Problems

Cisco.com

- Assume that IP connectivity has been checked
- Check TCP to find out what connections we are accepting Check the ports (TCP/179)

Check source/destination addresses – do they match the configuration?

Common problem:

iBGP is run between loopback interfaces on router (for stability), but the configuration is missing from the router **P** iBGP fails to establish

Remember that source address is the IP address of the outgoing interface unless otherwise specified

Peer Establishment: eBGP Problems

Cisco.com

 eBGP by and large is problem free for single point to point links

Source address is that of the outbound interface

Destination address is that of the outbound interface on the remote router

And is directly connected (TTL is set to 1 for eBGP peers)

Filters permit TCP/179 in both directions

Peer Establishment: eBGP Problems

Cisco.com

 Load balancing over multiple links and/or use of eBGP multihop gives potential for so many problems

IP Connectivity to the remote address

Filters somewhere in the path

eBGP by default sets TTL to 1, so you need to change this to permit multiple hops

 Some ISPs won't even allow their customers to use eBGP multihop due to the potential for problems

Peer Establishment: eBGP Problems

Cisco.com

eBGP multihop problems

IP Connectivity to the remote address

is a route in the local routing table?

is a route in the remote routing table?

Check this using ping, including the extended options that it has in most implementations

Filters in the path?

If this crosses multiple providers, this needs their cooperation

Peer Establishment: Passwords

Cisco.com

- Using passwords on iBGP and eBGP sessions
 Link won't come up
 Been through all the previous troubleshooting steps
- Common problems:

Missing password – needs to be on both ends

Cut and paste errors – don't!

Typographical errors

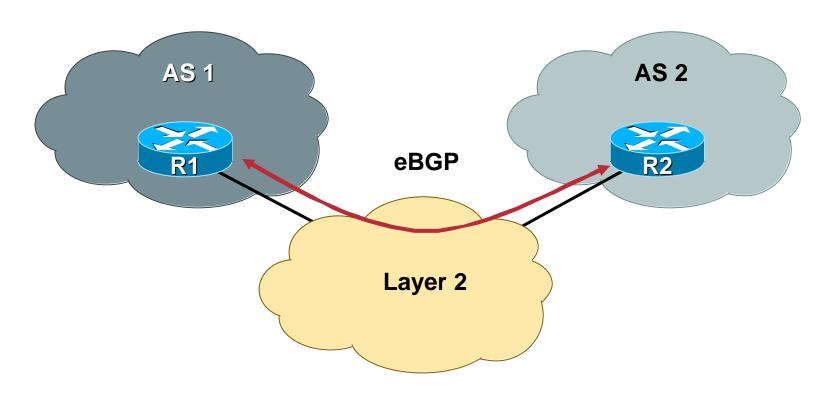

Capitalisation, extra characters, white space...

Common solutions:

Check for symptoms/messages in the logs

Re-enter passwords from scratch – don't cut&paste

Flapping Peer: Common Symptoms

- Symptoms the eBGP session flaps
- eBGP peering establishes, then drops, re-establishes, then drops,...

Flapping Peer: Common Symptoms

Cisco.com

- Ensure logging is enabled no logs ® no clue
- What do the logs say?

Problems are usually caused because BGP keepalives are lost

No keepalive P local router assumes remote has gone down, so tears down the BGP session

Then tries to re-establish the session – which succeeds

Then tries to exchange UPDATEs – fails, keepalives get lost, session falls over again

WHY??

Flapping Peer: Diagnosis and Solution

Cisco.com

Diagnosis

Keepalives get lost because they get stuck in the router's queue behind BGP update packets.

BGP update packets are packed to the size of the MTU – keepalives and BGP OPEN packets are not packed to the size of the MTU P Path MTU problems

Use ping with different size packets to confirm the above – 100byte ping succeeds, 1500byte ping fails = MTU problem somewhere

Solution

Pass the problem to the L2 folks – but be helpful, try and pinpoint using ping where the problem might be in the network

Flapping Peer: Other Common Problems

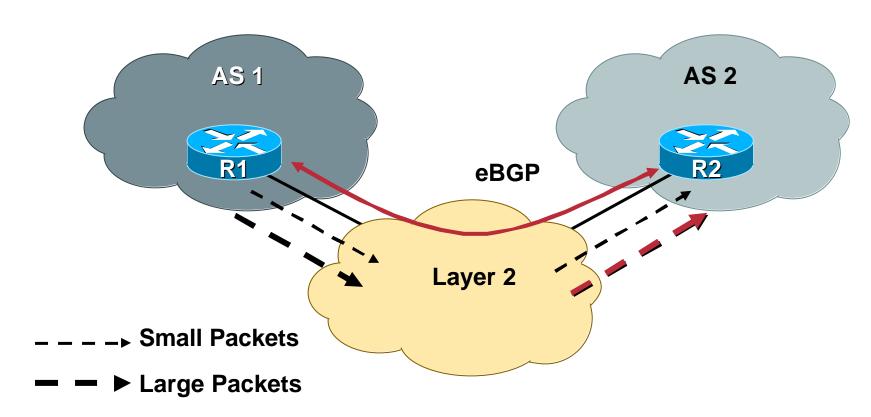

Cisco.com

- Remote router rebooting continually (typical with a 3-5 minute BGP peering cycle time)
- Remote router BGP process unstable, restarting
- Traffic Shaping & Rate Limiting parameters
- MTU incorrectly set on links, PMTU discovery disabled on router
- For non-ATM/FR links, instability in the L2 point-to-point circuits

Faulty MUXes, bad connectors, interoperability problems, PPP problems, satellite or radio problems, weather, etc. The list is endless – your L2 folks should know how to solve them

For you, ping is the tool to use

Flapping Peer: Fixed!

- Large packets are ok now
- BGP session is stable!

Local Configuration Problems

- Peer Establishment
- Missing Routes
- Inconsistent Route Selection
- Loops and Convergence Issues

Quick Review

Cisco.com

 Once the session has been established, UPDATEs are exchanged

All the locally known routes

Only the bestpath is advertised

 Incremental UPDATE messages are exchanged afterwards

- Bestpath received from eBGP peer
 Advertise to all peers
- Bestpath received from iBGP peer
 Advertise only to eBGP peers
 A full iBGP mesh must exist

Missing Routes—Agenda

- Route Origination
- UPDATE Exchange
- Filtering
- iBGP mesh problems

Missing Routes: Route Origination

Cisco.com

- Common problem occurs when putting prefixes into the BGP table
- BGP table is NOT the RIB

BGP table, as with OSPF table, ISIS table, static routes, etc, is used to feed the RIB, and hence the FIB

 To get a prefix into BGP, it must exist in another routing process too, typically:

Static route pointing to customer (for customer routes into your iBGP)

Static route pointing to Null (for aggregates you want to put into your eBGP)

Missing Routes

- Route Origination
- UPDATE Exchange
- Filtering
- iBGP mesh problems

Missing Routes: Update Exchange

Cisco.com

Ah, Route Reflectors...

Such a nice solution to help scale BGP

But why do people insist in breaking the rules all the time?!

Common issues

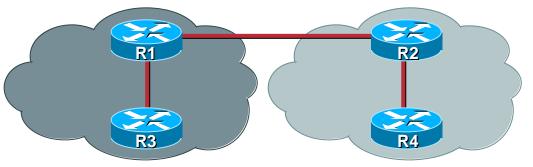

Clashing router IDs

Clashing cluster IDs

Missing Routes—Example I

Cisco.com

- Two RR clusters
- R1 is a RR for R3
- R2 is a RR for R4
- R4 is advertising
 7.0.0.0/8

 R2 has the route but R1 and R3 do not?

Missing Routes—Example I

Cisco.com

R1 is not accepting the route when R2 sends it on

Clashing router ID!

If R1 sees its own router ID in the originator attribute in any received prefix, it will reject that prefix

How a route reflector attempts to avoid routing loops

Solution

do NOT set the router ID by hand unless you have a very good reason to do so and have a very good plan for deployment

Router-ID is usually calculated automatically by router

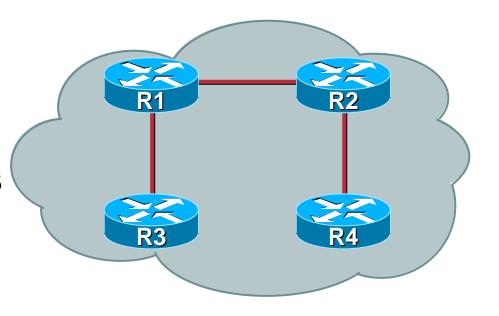

Missing Routes—Example II

Cisco.com

- One RR cluster
- R1 and R2 are RRs
- R3 and R4 are RRCs
- R4 is advertising
 7.0.0.0/8

R2 has it

R1 and R3 do not

Missing Routes—Example II

Cisco.com

R1 is not accepting the route when R2 sends it on

If R1 sees its own router ID in the cluster-ID attribute in any received prefix, it will reject that prefix

How a route reflector avoids redundant information

Reason

Early documentation claimed that RRC redundancy should be achieved by dual route reflectors in the same cluster

This is fine and good, but then ALL clients must peer with both RRs, otherwise examples like this will occur

Solution

Use overlapping RRCs for redundancy, stick to defaults

Missing Routes

- Route Origination
- UPDATE Exchange
- Filtering
- iBGP mesh problems

Update Filtering

Cisco.com

Type of filters

Prefix filters

AS_PATH filters

Community filters

Policy/Attribute manipulation

Applied incoming and/or outgoing

Update Filtering

Cisco.com

- If you suspect a filtering problem, become familiar with the router tools to find out what BGP filters are applied
- Tip: don't cut and paste!

Many filtering errors and diagnosis problems result from cut and paste buffer problems on the client, the connection, and even the router

Update Filtering: Common Problems

Cisco.com

Typos in regular expressions

Extra characters, missing characters, white space, etc

In regular expressions every character matters, so accuracy is highly important

Typos in prefix filters

Watch the router CLI, and the filter logic – it may not be as obvious as you think, or as simple as the manual makes out

Watch netmask confusion, and 255 profusion – easy to muddle 255 with 0 and 225!

Update Filtering: Common Problems

Cisco.com

Communities

Each implementation has different defaults for when communities are sent

Some don't send communities by default

Others do for iBGP and not for eBGP by default

Others do for all BGP peers by default

Watch how your implementation handles communities

There may be implicit filtering rules

Each ISP has different policies – never assume that because communities exist that people will use them, or pay attention to the ones you send

Missing Routes: General Problems

Cisco.com

Make and then Stick to simple policy rules:

Most implementations have particular rules for filtering of prefixes, AS-paths, and for manipulating BGP attributes

Try not to mix these rules

Rules for manipulating attributes can also be used for filtering prefixes and ASNs – can be very powerful, but can also become very confusing

Missing Routes

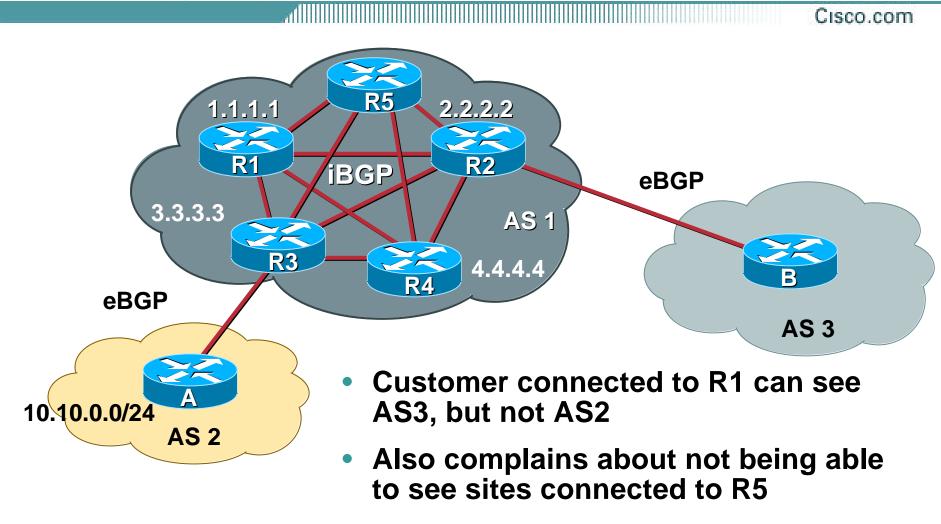

- Route Origination
- UPDATE Exchange
- Filtering
- iBGP mesh problems

Cisco.com

Symptom: customer complains about patchy Internet access

Can access some, but not all, sites connected to backbone

Can access some, but not all, of the Internet

No complaints from other customers

Cisco.com

Diagnosis: This is the classic iBGP mesh problem

The full mesh isn't complete – how do we know this?

Customer is connected to R1

Can't see AS2 PR3 is somehow not passing routing information about AS2 to R1

Can't see R5 P R5 is somehow not passing routing information about sites connected to R5

But can see rest of the Internet **P** his prefix is being announced to some places, so not an iBGP origination problem

Cisco.com

 When using full mesh iBGP, check on every iBGP speaker that it has a neighbour relationship with every other iBGP speaker

In this example, R3 peering with R1 is down as R1 isn't seeing any of the routes connected through R3

 Try and use configuration shorthand if available in your implementation

Peering between R1 and R5 was down as there was a typo in the shorthand, resulting in the incorrect configuration being used

Troubleshooting Tips

Cisco.com

 Use configuration shorthand both for efficiency and to avoid making policy errors within the iBGP mesh

This is especially true for full iBGP mesh networks

But be careful of not introducing typos into names of these "subroutines" – common problem

 Use route reflectors to avoid accidentally missing iBGP peers, especially as the mesh grows in size

But stick to the route reflector rules and the defaults in the implementation – changing defaults and ignoring BCP techniques introduces complexity and causes problems

Local Configuration Problems

- Peer Establishment
- Missing Routes
- Inconsistent Route Selection
- Loops and Convergence Issues

Inconsistent Route Selection

- Two common problems with route selection Inconsistency
 Appearance of an incorrect decision
- RFC 1771 defines the decision algorithm
- Every vendor has tweaked the algorithm <u>http://www.cisco.com/warp/public/459/25.shtml</u>
- Route selection problems can result from oversights by RFC 1771

Inconsistent—Example I

Cisco.com

- RFC says that MED is not always compared
- As a result, the ordering of the paths can effect the decision process
- For example, the default in Cisco IOS is to compare the prefixes in order of arrival (most recent to oldest)

This can result in inconsistent route selection

Symptom is that the best path chosen after each BGP reset is different

Inconsistent—Example I

Cisco.com

Inconsistent route selection may cause problems

Routing loops

Convergence loops—i.e. the protocol continuously sends updates in an attempt to converge

Changes in traffic patterns

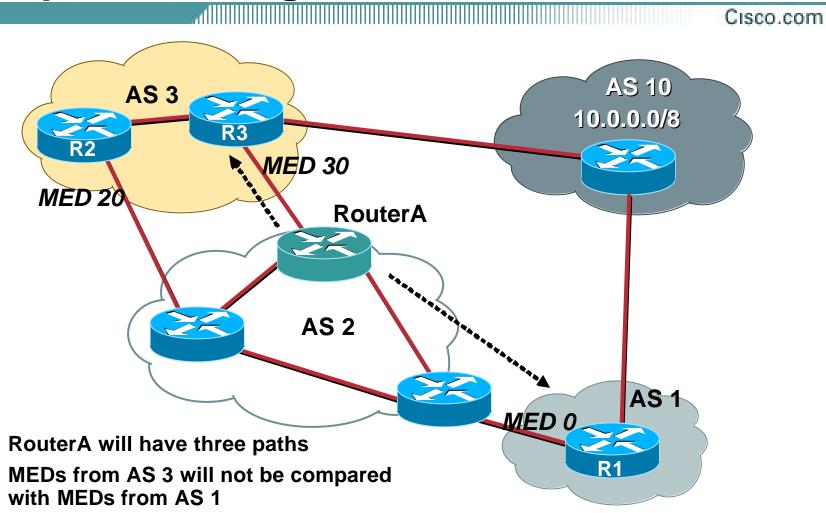

Difficult to catch and troubleshoot

In Cisco IOS, the deterministic-med configuration command is used to order paths consistently

Enable in all the routers in the AS

The bestpath is recalculated as soon as the command is entered

Symptom I—Diagram

 RouterA will sometimes select the path from R1 as best and but may also select the path from R3 as best

Deterministic MED—Operation

- The paths are ordered by Neighbour AS
- The bestpath for each Neighbour AS group is selected
- The overall bestpath results from comparing the winners from each group
- The bestpath will be consistent because paths will be placed in a deterministic order

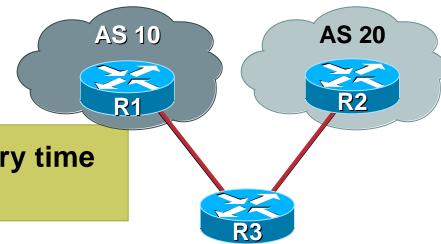

Solution—Diagram

RouterA will consistently select the path from R1 as best!

Inconsistent—Example II

Cisco.com

The bestpath changes every time the peering is reset

 By default, the "oldest" external is the bestpath

All other attributes are the same Stability Enhancement in Cisco IOS

 The BGP sub-command "bestpath compare-router-id" will disable this enhancement

Inconsistent—Example III

Cisco.com

- Path 1 has higher localpref but path 2 is better???
- This appears to be incorrect...

 It's because Cisco IOS has "synchronization" on by default

...and if a prefix is not synchronized (i.e. appearing in IGP as well as BGP), its path won't be included in the bestpath process

Inconsistent Path Selection

Cisco.com

Summary:

RFC1771 isn't prefect when it comes to path selection – years of operational experience have shown this

Vendors and ISPs have worked to put in stability enhancements

But these can lead to interesting problems

And of course some defaults linger much longer than they ought to – so never assume that an out of the box default configuration will be perfect for your network

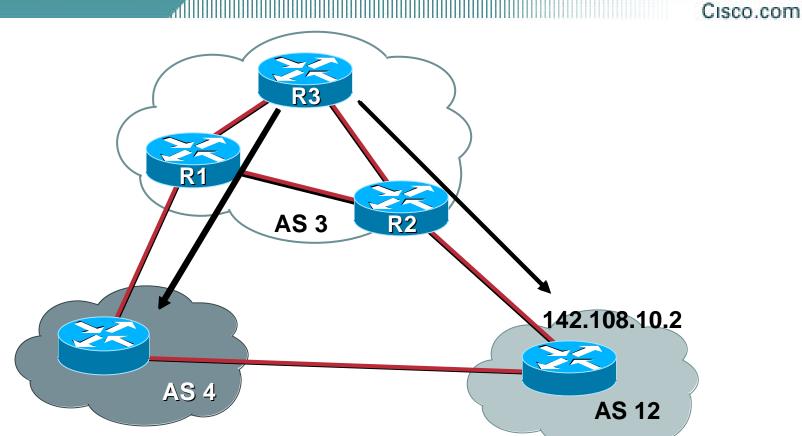

Local Configuration Problems

- Peer Establishment
- Missing Routes
- Inconsistent Route Selection
- Loops and Convergence Issues

Route Oscillation

- One of the most common problems!
- Every minute routes flap in the routing table from one nexthop to another
- With full routes the most obvious symptom is high CPU in "BGP Router" process

Route Oscillation—Diagram

- R3 prefers routes via AS 4 one minute
- 1 minute later R3 prefers routes via AS 12
- And 1 minute after that R3 prefers AS 4 again

Route Oscillation—Symptom

Cisco.com

 Main symptom is that traffic exiting the network oscillates every minute between two exit points

This is almost *always* caused by the BGP NEXT_HOP being known only by BGP

Common problem in ISP networks – but if you have never seen it before, it can be a nightmare to debug and fix

 Other symptom is high CPU utilisation for the BGP router process

Route Oscillation—Cause

- BGP nexthop is known via BGP
 This is an illegal recursive lookup
- Scanner will notice, drop this path, and install the other path in the RIB
- Route to the nexthop is now valid
- Scanner will detect this and re-install the other path
- Routes will oscillate forever
 One minute cycle in Cisco IOS as scanner runs every minute

Route Oscillation—Solution

Cisco.com

 Make sure that all the BGP NEXT_HOPs are known by the IGP

(whether OSPF/ISIS, static or connected routes)

If NEXT_HOP is also in iBGP, ensure the iBGP distance is longer than the IGP distance

-or-

- Don't carry external NEXT_HOPs in your network
 Use "next-hop-self" concept on all the edge BGP routers
- Two simple solutions

Troubleshooting Tips

- High CPU utilisation in the BGP process is normally a sign of a convergence problem
- Find a prefix that changes every minute
- Troubleshoot/debug that one prefix

Troubleshooting Tips

Cisco.com

BGP routing loop?

First, check for IGP routing loops to the BGP NEXT_HOPs

BGP loops are normally caused by

Not following physical topology in RR environment

Multipath with confederations

Lack of a full iBGP mesh

Get the following from each router in the loop path

The routing table entry

The BGP table entry

The route to the NEXT_HOP

Convergence Problems: Example I

Cisco.com

Route reflector with 250 route reflector clients

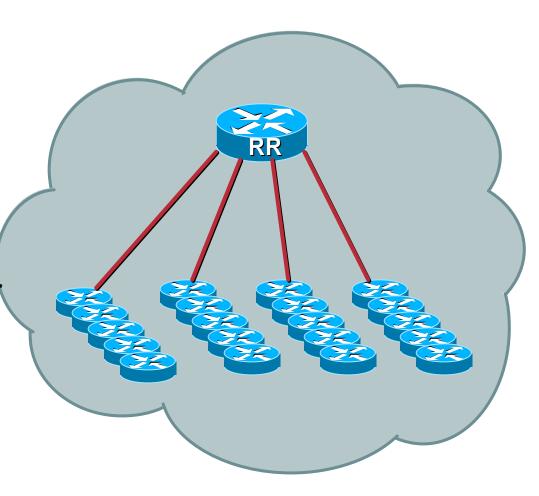

100k routes

BGP will not converge

 Logs show that neighbour hold times have expired

 The BGP router summary shows peers establishing, dropping, re-establishing

And it's not the MTU problem we saw earlier!

Convergence Problems: Example I

- We are either missing hellos or our peers are not sending them
- Check for interface input drops
 - If the number is large, and the interface counters show recent history, then this is probably the cause of the peers going down
- Large drops is usually due to the input queue being too small
 - Large numbers of peers can easily overflow the queue, resulting in lost hellos
- Solution is to increase the size of the input queues to be considerably larger than the number of peers

Convergence Problems: Example II

Cisco.com

BGP converges in 25 minutes for 250 peers and 100k routes

Seems like a long time What is TCP doing?

Check the MSS size

And enable Path MTU discovery on the router if it is not on by default

MSS of 536 means that router needs to send almost three times the amount of packets compared with an MSS of 1460

Result:

Should see BGP converging in about half the time – which is respectable for 250 peers and 100k routes

Agenda

- Fundamentals
- Local Configuration Problems
- Internet Reachability Problems

Internet Reachability Problems

Cisco.com

BGP Attribute Confusion

To Control Traffic in ® Send MEDs and AS-PATH prepends on outbound announcements

To Control Traffic out ® Attach local-preference to inbound announcements

 Troubleshooting of multihoming and transit is often hampered because the relationship between routing information flow and traffic flow is forgotten

Internet Reachability Problems

Cisco.com

BGP Path Selection Process

Each vendor has "tweaked" the path selection process

Know it, learn it, for your router equipment – saves time later

MED confusion

Default MED on Cisco IOS is ZERO – it may not be this on your router, or your peer's router

Internet Reachability Problems

Cisco.com

Community confusion

set community does just that – it overwrites any other community set on the prefix

Use additive keyword to add community to existing list

Use Internet format for community (AS:xx) not the 32-bit IETF format

Cisco IOS never sends community by default

Other implementations may send community by default for iBGP and/or eBGP

Never assume that your neighbouring AS will honour your no-export community – ask first!

Internet Reachability Problems

Cisco.com

AS-PATH prepends

20 prepends won't lessen the priority of your path any more than 10 prepends will – check it out at a Looking Glass

The Internet is on average only 5 ASes deep, maximum AS prepend most ISPs have to use is around this too

Know you BGP path selection algorithm

Some ISPs use bgp maxas-path 15 to drop prefixes with ridiculously long AS-paths

Internet Reachability Problems

Cisco.com

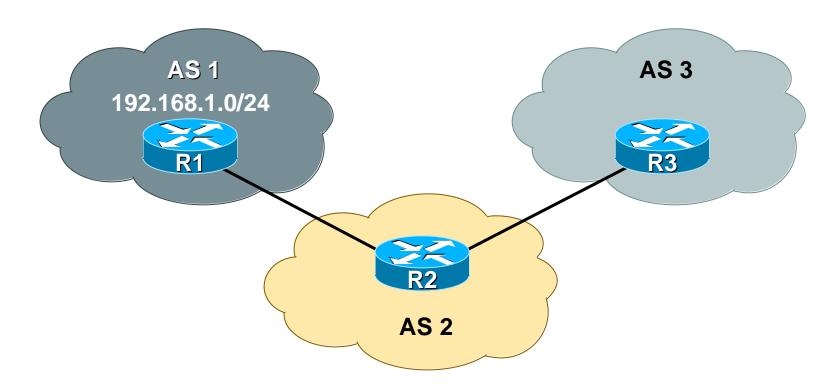

- Private ASes should not ever appear in the Internet
- Cisco IOS remove-private-AS command does not remove every instance of a private AS

e.g. won't remove private AS appearing in the middle of a path surrounded by public ASNs

www.cisco.com/warp/public/459/32.html

 Apparent non-removal of private-ASNs may not be a bug, but a configuration error somewhere else

Cisco.com

 Symptom: AS1 announces 192.168.1.0/24 to AS2 but AS3 cannot see the network

Cisco.com

• Checklist:

AS1 announces, but does AS2 see it?

We are checking eBGP filters on R1 and R2. Remember that R2 access will require cooperation and assistance from your peer

Does AS2 see it over entire network?

We are checking iBGP across AS2's network (unneeded step in this case, but usually the next consideration). Quite often iBGP is misconfigured, lack of full mesh, problems with RRs, etc.

Cisco.com

• Checklist:

Does AS2 send it to AS3?

We are checking eBGP configuration on R2. There may be a configuration error with as-path filters, or prefix-lists, or communities such that only local prefixes get out

Does AS3 see all of AS2's originated prefixes?

We are checking eBGP configuration on R3. Maybe AS3 does not know to expect prefixes from AS1 in the peering with AS2, or maybe it has similar errors in as-path or prefix or community filters

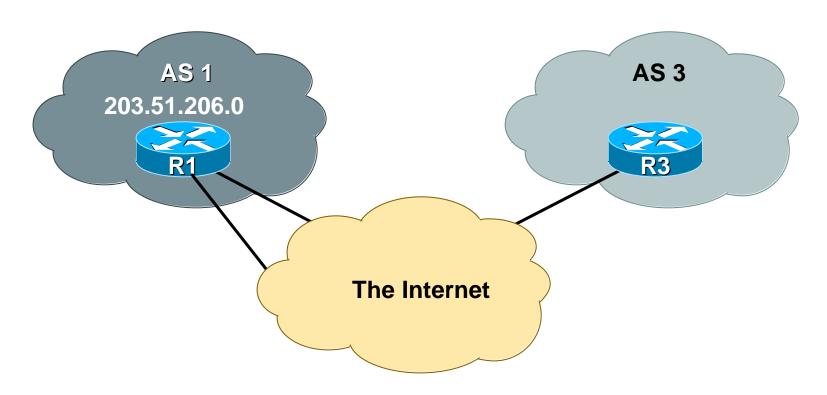

Cisco.com

 Troubleshooting connectivity beyond immediate peers is much harder

Relies on your peer to assist you – they have the relationship with their BGP peers, not you

Quite often connectivity problems are due to the private business relationship between the two neighbouring ASNs

Cisco.com

 Symptom: AS1 announces 203.51.206.0/24 to its upstreams but AS3 cannot see the network

Cisco.com

• Checklist:

AS1 announces, but do its upstreams see it?

We are checking eBGP filters on R1 and upstreams. Remember that upstreams will need to be able to help you with this

Is the prefix visible anywhere on the Internet?

We are checking if the upstreams are announcing the network to anywhere on the Internet. See next slides on how to do this.

Cisco.com

- Help is at hand the Looking Glass
- Many networks around the globe run Looking Glasses

These let you see the BGP table and often run simple ping or traceroutes from their sites

www.traceroute.org for IPv4
www.traceroute6.org for IPv6

- Many still use the original: <u>nitrous.digex.net</u>
- Next slides have some examples of a typical looking glass in action

RIS - Looking Glass

whois db

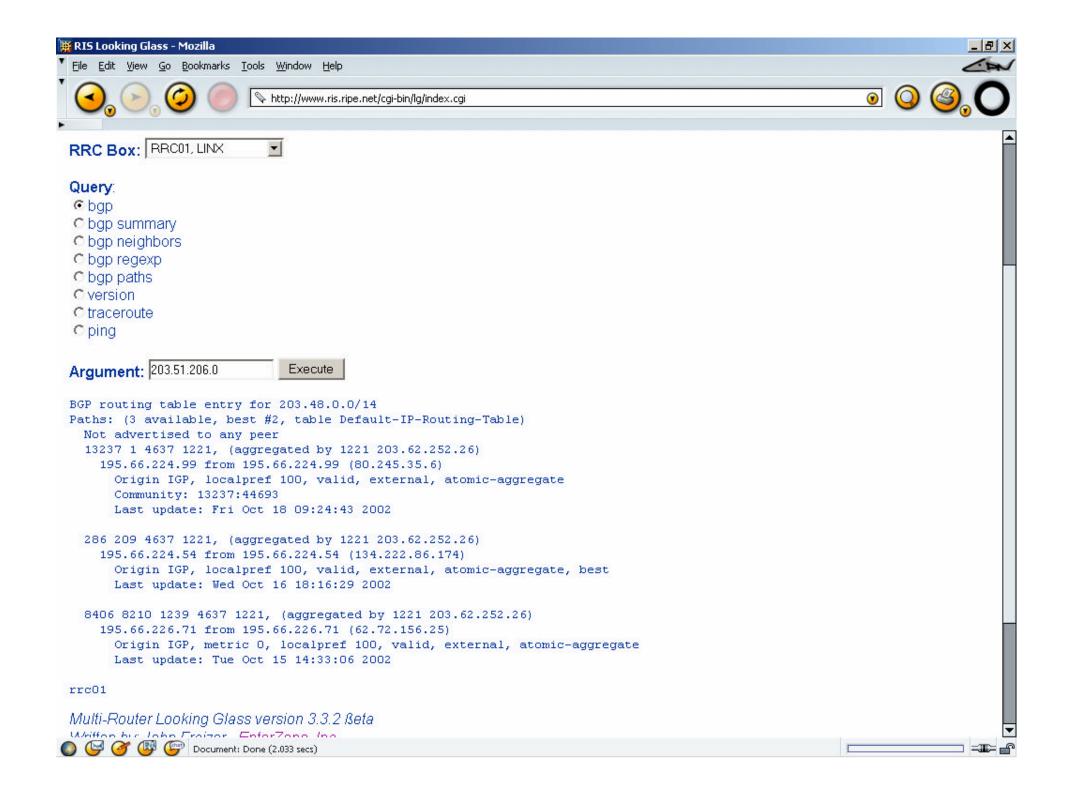

homepage what's new

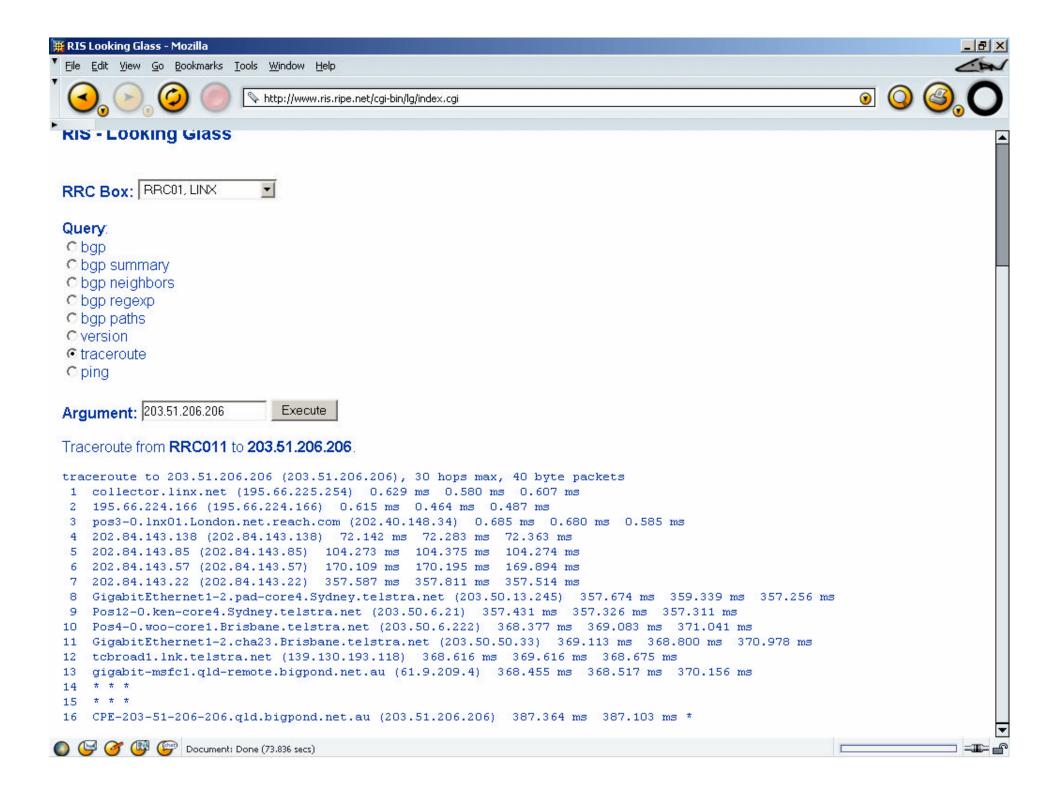

Cisco.com

Hmmm....

upstream

- Looking Glass can see 203.48.0.0/14
 This includes 203.51.206.0/24
 So the problem must be with AS3, or AS3's
- A traceroute confirms the connectivity

Cisco.com

- Help is at hand RouteViews
- The RouteViews router has BGP feeds from around 60 peers

www.routeviews.org explains the project

Gives access to a real router, and allows any provider to find out how their prefixes are seen in various parts of the Internet

Complements the Looking Glass facilities

Anyway, back to our problem...

Cisco.com

• Checklist:

Does AS3's upstream send it to AS3?

We are checking eBGP configuration on AS3's upstream. There may be a configuration error with as-path filters, or prefix-lists, or communities such that only local prefixes get out. This needs AS3's assistance.

Does AS3 see any of AS1's originated prefixes?

We are checking eBGP configuration on R3. Maybe AS3 does not know to expect the prefix from AS1 in the peering with its upstream, or maybe it has some errors in as-path or prefix or community filters

Cisco.com

- Troubleshooting across the Internet is harder But tools are available
- Looking Glasses, offering traceroute, ping and BGP status are available all over the globe

Most connectivity problems seem to be found at the edge of the network, rarely in the transit core

Problems with the transit core are usually intermittent and short term in nature

Cisco.com The Internet AS 2 AS₃ **AS 1**

 Symptom: AS1 is trying to loadshare between its upstreams, but has trouble getting traffic through the AS2 link

Cisco.com

Checklist:

What does "trouble" mean?

Is outbound traffic loadsharing okay?

Can usually fix this with selectively rejecting prefixes, and using local preference

Generally easy to fix, local problem, simple application of policy

Is inbound traffic loadsharing okay?

Errummm, bigger problem if not

Need to do some troubleshooting if configuration with communities, AS-PATH prepends, MEDs and selective leaking of subprefixes don't seem to help

Cisco.com

• Checklist:

AS1 announces, but does AS2 see it?

We are checking eBGP filters on R1 and R2. Remember that R2 access will require cooperation and assistance from your peer

Does AS2 see it over entire network?

We are checking iBGP across AS2's network. Quite often iBGP is misconfigured, lack of full mesh, problems with RRs, etc.

Cisco.com

• Checklist:

Does AS2 send it to its upstream?

We are checking eBGP configuration on R2. There may be a configuration error with as-path filters, or prefix-lists, or communities such that only local prefixes get out

Does the Internet see all of AS2's originated prefixes?

We are checking eBGP configuration on other Internet routers. This means using looking glasses. And trying to find one as close to AS2 as possible.

Cisco.com

Checklist:

Repeat all of the above for AS3

- Stopping here and resorting to a huge prepend towards AS3 won't solve the problem
- There are many common problems listed on next slide

And tools to help decipher the problem

Cisco.com

No inbound traffic from AS2

AS2 is not seeing AS1's prefix, or is blocking it in inbound filters

A trickle of inbound traffic

Switch on NetFlow (if the router has it) and check the origin of the traffic

If it is just from AS2's network blocks, then is AS2 announcing the prefix to its upstreams?

If they claim they are, ask them to ask their upstream for their BGP table – or use a Looking Glass to check

Cisco.com

 A light flow of traffic from AS2, but 50% less than from AS3

Looking Glass comes to the rescue

LG will let you see what AS2, or AS2's upstreams are announcing

AS1 may choose this as primary path, but AS2 relationship with their upstream may decide otherwise

NetFlow comes to the rescue

Allows AS1 to see what the origins are, and with the LG, helps AS1 to find where the prefix filtering culprit might be

Cisco.com The Internet AS 2 AS₃ **AS 1**

 Symptom: AS1 is loadsharing between its upstreams, but the traffic load swings randomly between AS2 and AS3

Cisco.com

• Checklist:

Assume AS1 has done everything in this tutorial so far

All the configurations look fine, the Looking Glass outputs look fine, life is wonderful... Apart from those annoying traffic swings every hour or so

L2 problem? Route Flap Damping?

Since BGP is configured fine, and the net has been stable for so long, can only be an L2 problem, or Route Flap Damping side-effect

Cisco.com

 L2 – upstream somewhere has poor connectivity between themselves and the rest of the Internet

Only real solution is to impress upon upstream that this isn't good enough, and get them to fix it

Or change upstreams

Cisco.com

Route Flap Damping

Many ISPs implement route flap damping

Many ISPs simply use the vendor defaults

Vendor defaults are generally far too severe

There is even now some real concern that the "more lenient" RIPE-229 values are too severe

www.cs.berkeley.edu/~zmao/Papers/sig02.pdf

Again Looking Glasses come to the operator's assistance

Cisco.com

 Most Looking Glasses allow the operators to check the flap or damped status of their announcements

Many oscillating connectivity issues are usually caused by L2 problems

Route flap damping will cause connectivity to persist via alternative paths even though primary paths have been restored

Quite often, the exponential back off of the flap damping timer will give rise to bizarre routing

Common symptom is that bizarre routing will often clear away by itself

Troubleshooting Summary

Cisco.com

- Most troubleshooting is about:
- Experience

Recognising the common problems

- Not panicking
- Logical approach

Check configuration first

Check locally first before blaming the peer

Troubleshoot layer 1, then layer 2, then layer 3, etc

Troubleshooting Summary

Cisco.com

- Most troubleshooting is about:
- Using the available tools

The debugging tools on the router hardware

Internet Looking Glasses

Colleagues and their knowledge

Public mailing lists where appropriate

Agenda

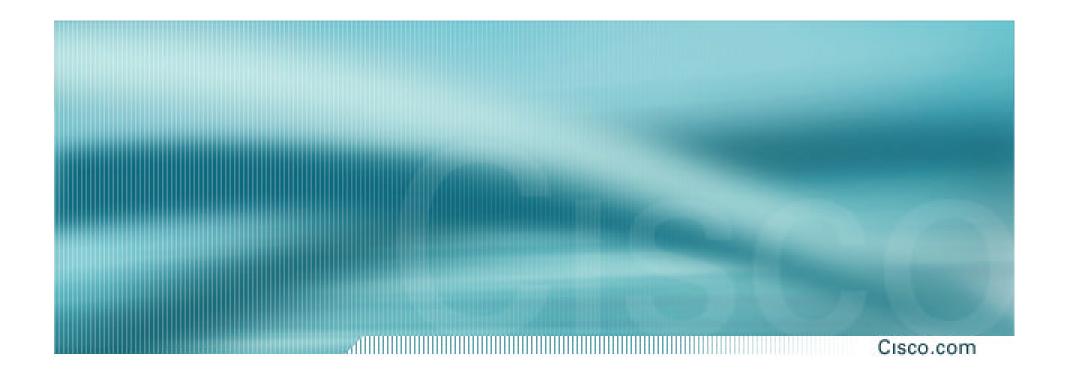

Cisco.com

- Fundamentals
- Local Configuration Problems
- Internet Reachability Problems

Closing Comments

Cisco.com

- Presentation has covered the most common troubleshooting techniques used by ISPs today
- Once these have been mastered, more complex or arcane problems are easier to solve
- Feedback and input for future improvements is encouraged and very welcome

Troubleshooting BGP

The End!
