A Short History of the Internet

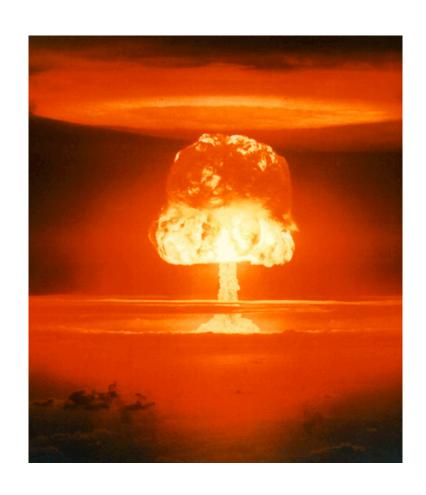

NANOG

February 9, 2003

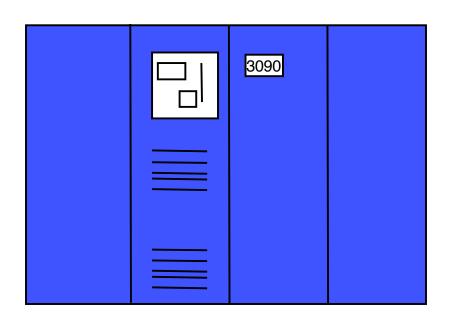

Scott Bradner

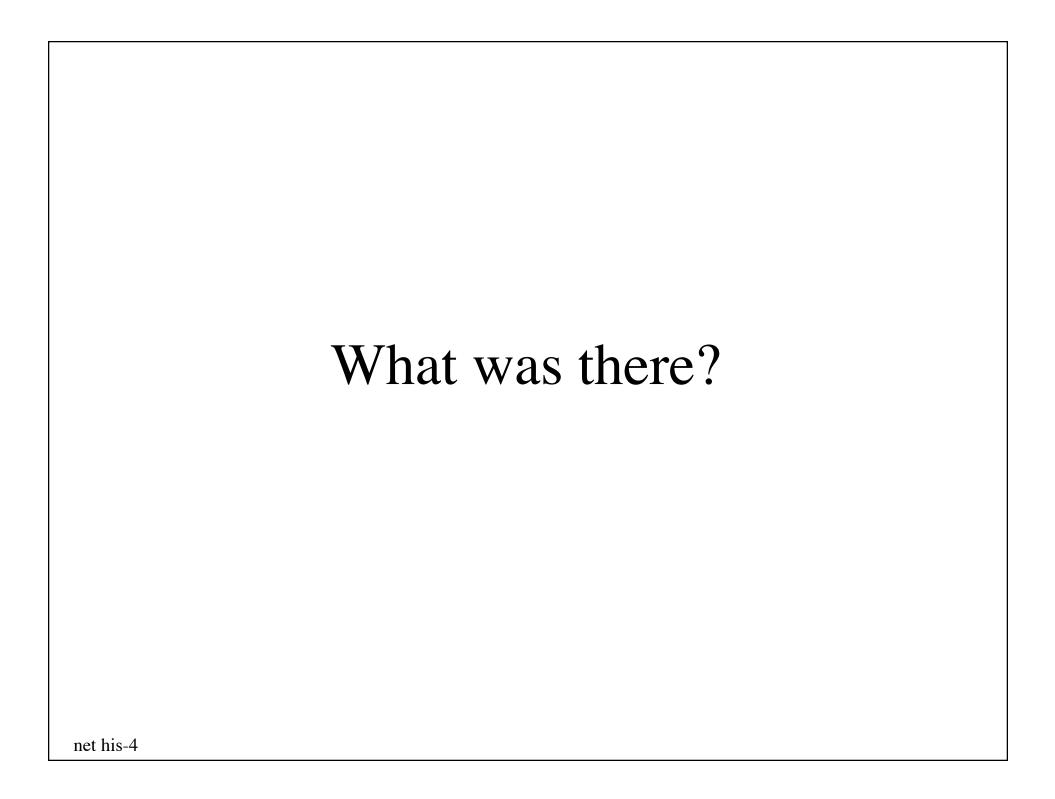

Harvard University sob@harvard.edu

The Phone Net from The Phone Company (TPC)

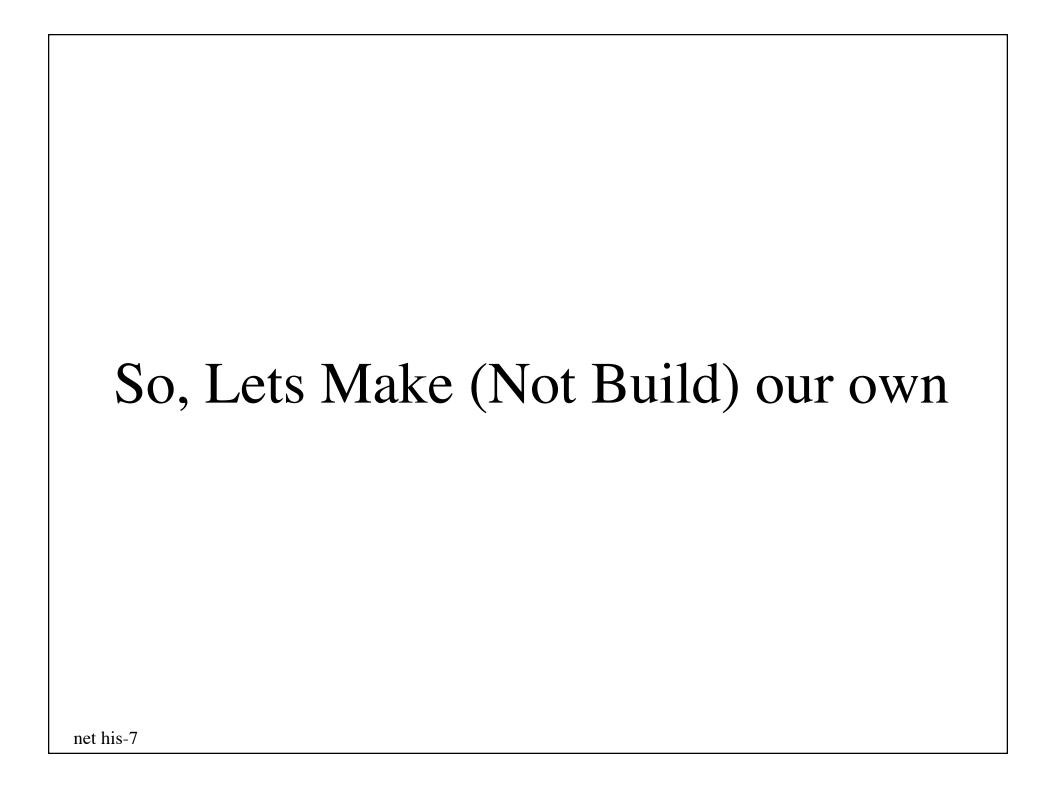

(trivia alert)

assumed simple & predictable interconnections
between ends
assumed requirement for QoS
assumption of being carrier-provided

voice-oriented

What Was Wrong With That?

nothing, if you just wanted to talk nothing, if you just wanted to talk to Joe nothing, if you just wanted one service trick question - what does a **fast busy** signal mean? nothing, if you thought that AT&T innovated note: this was pre breakup & pre Carterphone nothing, if you wanted your data service provided to the wall by a carrier

multiple unrelated efforts (early to mid 1960's)

packet switching theory: (Kleinrock) 1961

day dreaming: (Licklider's Galactic Network) 1962

make use of remote expensive computers: (Roberts) 1964

survivable infrastructure for voice and data: (Baron) 1964

ARPANET (late 1960's)

Roberts ARPANET paper 1967

RFP for Interface Message Processor won by BBN 1968

four ARPANET hosts by 1969

public demo and email in 1972

Dest Addr Src Addr

payload

- 0/ multiplexed utilization of existing networks
- 1/ survivability in the face of failure
- 2/ support multiple types of communications service
- 3/ accommodate a variety of network types
- 4/ permit distributed management of resources
- 5/ cost effective
- 6/ low effort to attach a host
- 7/ account for use of resources

!security !QoS !efficiency

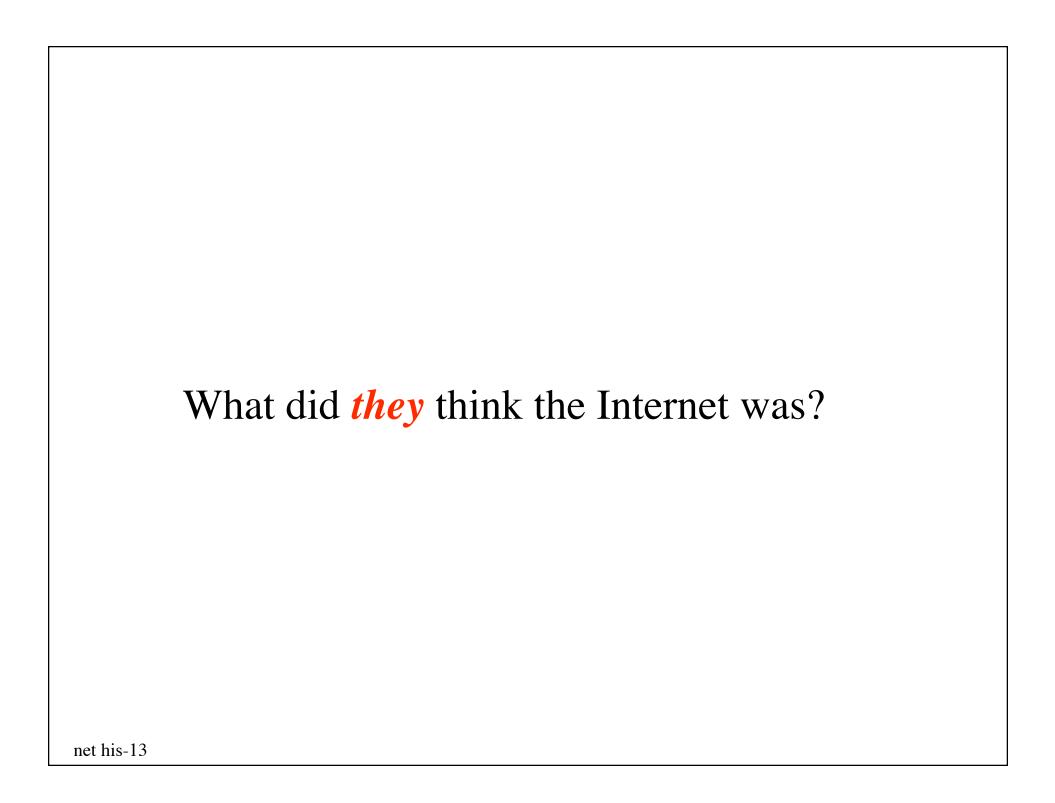

Non Goal

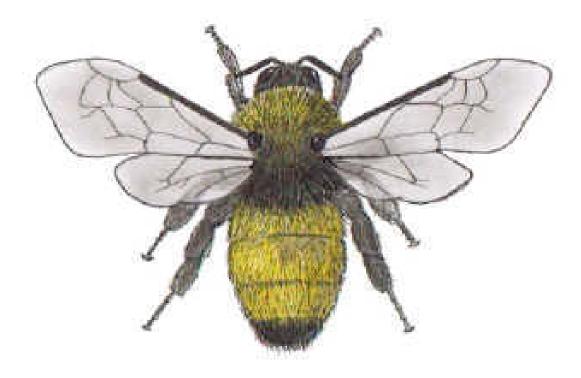

"the lesson of the Internet is that efficiency is not the primary consideration. Ability to grow and adapt to changing requirements is the primary consideration. This makes simplicity and uniformity very precious indeed."

Bob Braden

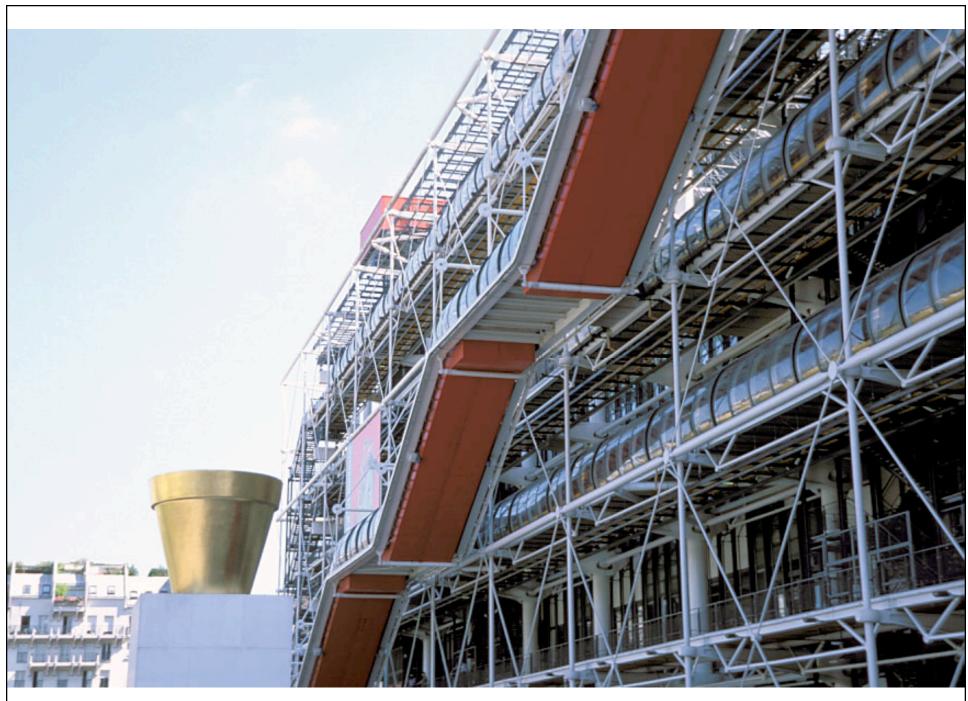

IETF mailing list 2-Feb-2001

"Huh?" (says the phone world)

by definition

Architecture Feature

service can be provided by 3rd parties - not just by carriers

a quote from an IETF mailing list

Hi Roy,

I still don't understand why it is a "users" choice where the "services" are executed - I would have thought that this would be networks choice

Feature of Architecture Feature

ISP does not profit from services running over network telcos do not grok concept

AT&T building "content aware" next-gen network

"We do not know how to route money"

Dave Clark

Another Feature of Architecture Feature

```
no "tapping" point
  traffic does not flow in a tree
security (authentication, encription) is e2e
  where "e" could be server somewhere
not even in an ISP
  traffic between customers on same POP stays
  in POP
no knowledge of geographical location
```

governments do not grok concept

The Importance of Phones (or emergency traffic, or ...)

I'm more important!

I'm more important!

I'm more important!

I'm more important!

I'm more important!

Are Differentiated Services an Answer?

pay more to get a better service?

a way for ISP to get application-based revenue but the Internet is not consistently crappy enough

"It fails to fail often enough so it looks like it works."

Mike O'Dell

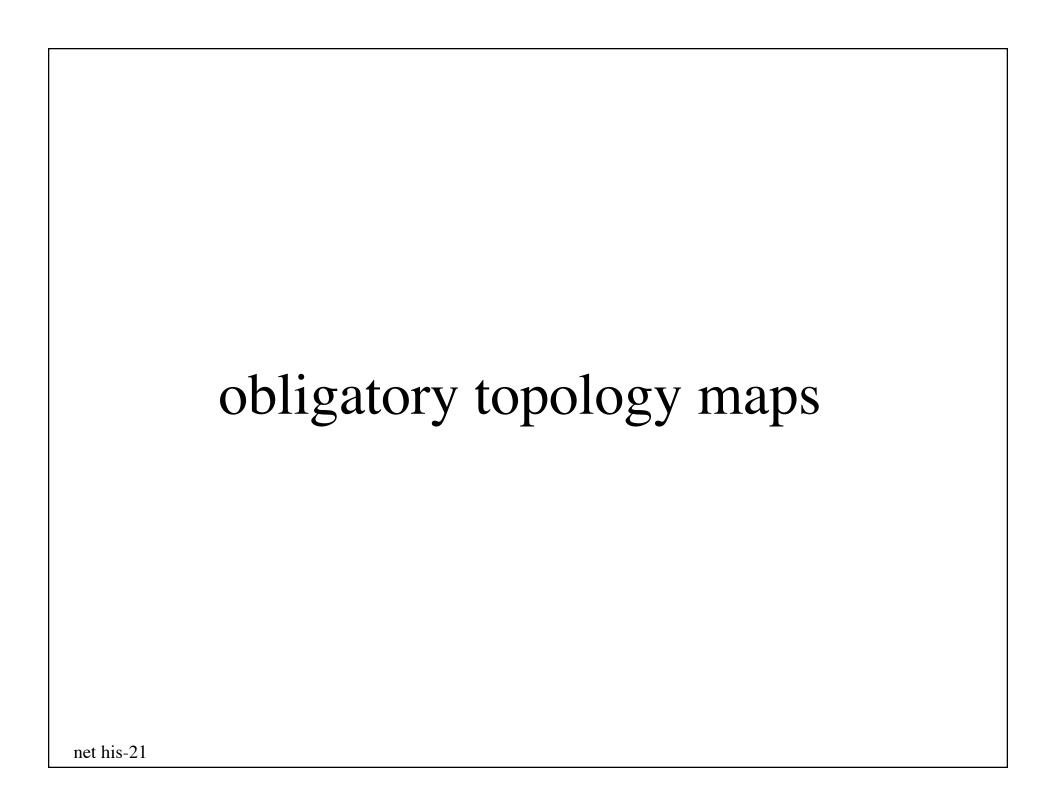

assumption:

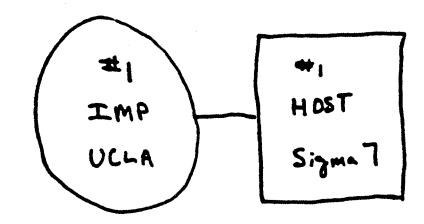

you will pay more every time to make the service better some of the time

e.g., IAD- vs. Ethernet-attached phones (IQ test)

IT managers: yes, real world: ???

e.g. VoIP in enterprises

diversions

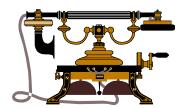

"he has an out of balance ego to clue ratio"

Dave Clark

there is no need to fund the 'NSFnet', we can provide data connectivity with ISDN late '80s

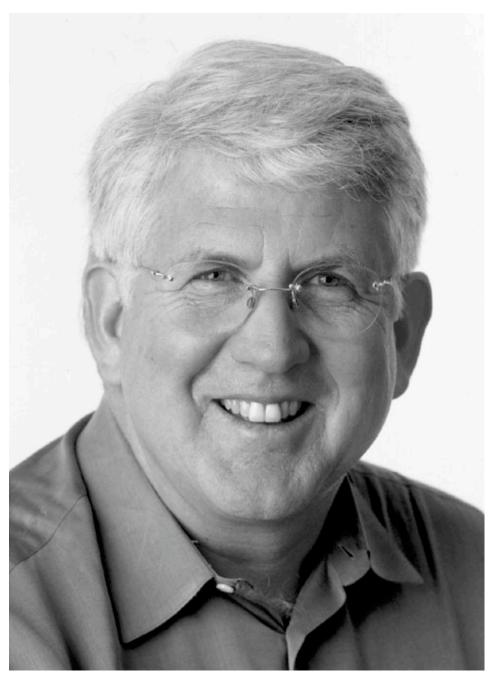

OSI is the answer, what was the question?

various governments and corporations

Internet collapse imminent - .gif at 11

Bob Metcalfe ex-pundit

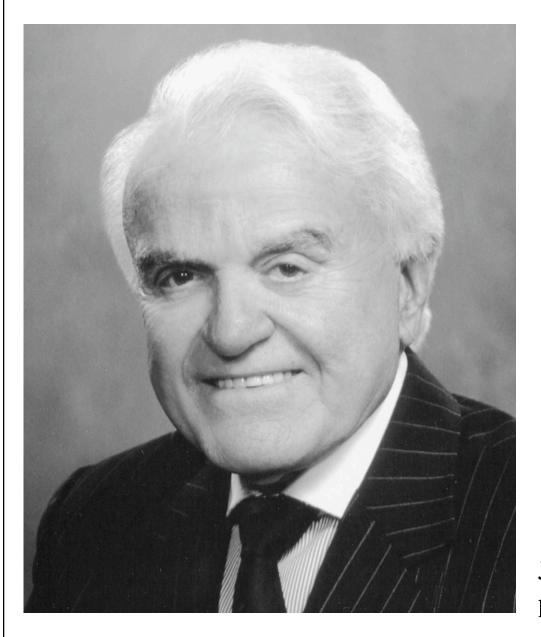

net his-37

ATM is the answer, do we need a question?

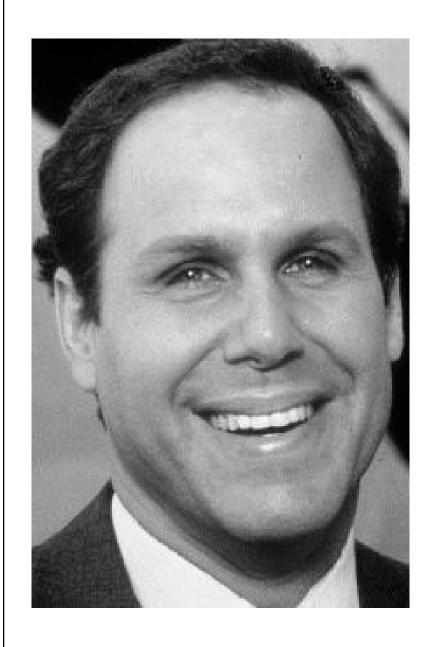

John McQuillan one of the idle rich

\$\$\$\$\$\$ \$\$\$\$\$\$

what makes you think you own the movie you bought?

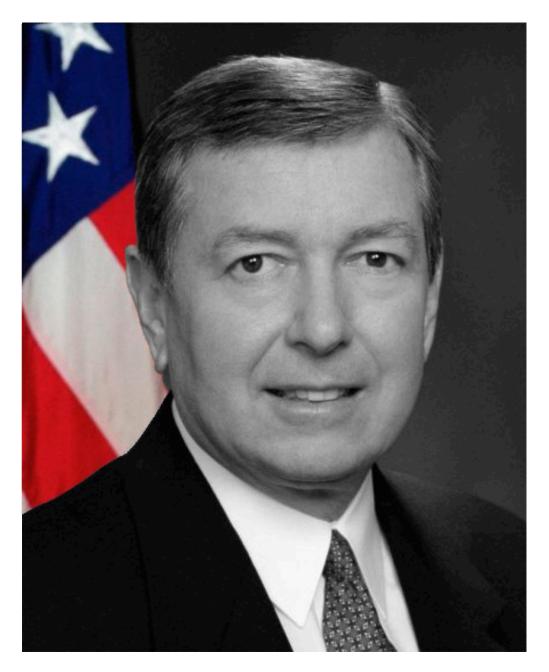

Jack Valenti president & CEO MPAA

and I say that 200 years *is* a limited period

Michael Eisner chairman, Walt Disney

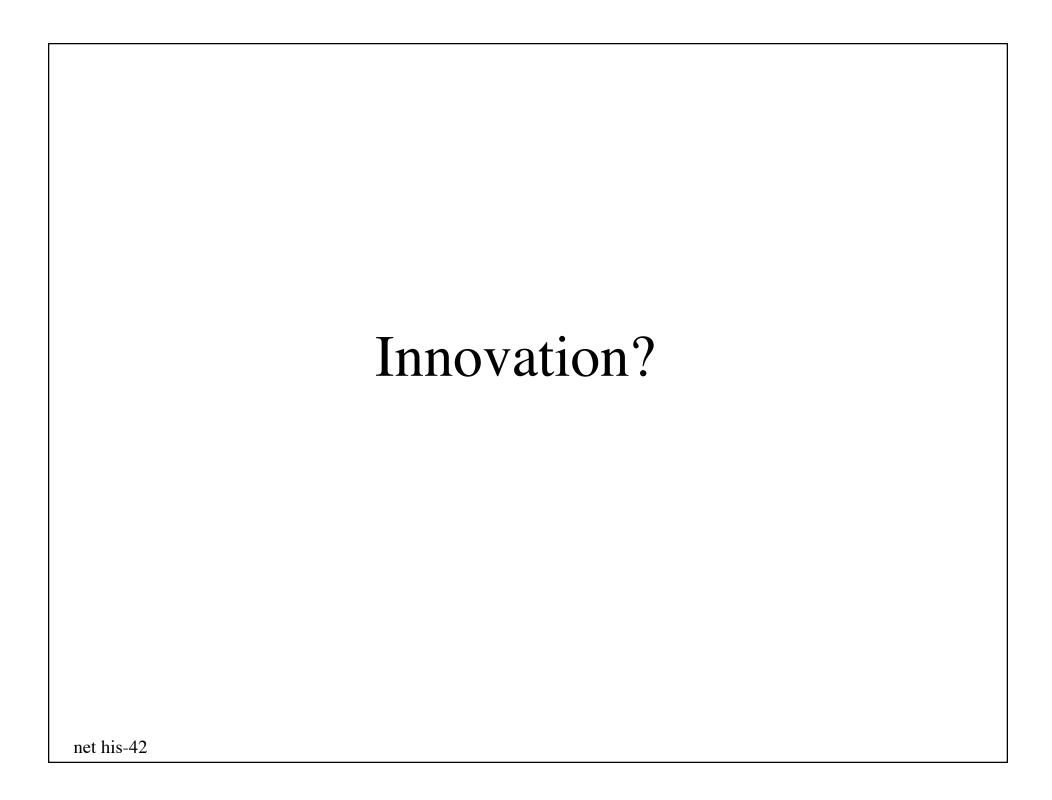

the answer is
National Security
but the question is
secret

John Ashcroft US Attorney General

PBS American Experience show on "1900"

"The turn of the century, particularly in America, represented a period that will someday be compared to the Renaissance. Within a period of very short time, 15-20 years, most of the breakthroughs in technology occurred that now influence our lives so heavily. Everything since then has been engineering. You capture motion. Motion picture comes about this time. Now everything since is engineering. It's technology. Sure, the picture's better, but the idea of seeing people move on a screen is new. The telephone. "Hello? I'm talking to Chicago." A miracle. But we take it for granted. You break through and record sound. It's gotten better, but everything since is simply engineering."

Imitation

good for learning but one needs to move beyond

New Inet (since 1900) Applications

web

mail (increasingly a.k.a spam), FAX, IM

remote login

data transfer, storage

commerce

audio & video

search

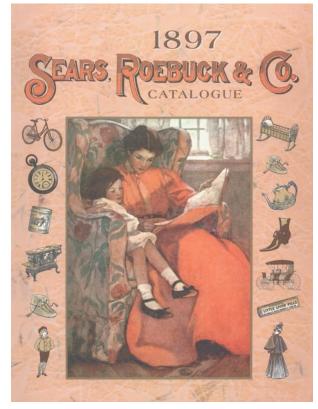

content

How Important is the E?

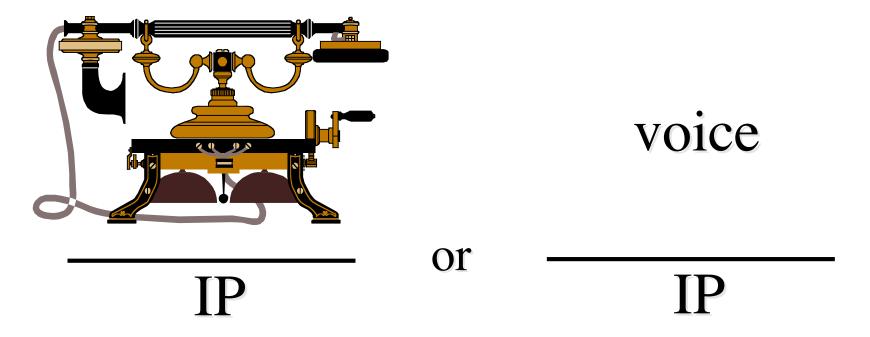

how much in e-commerce is new?

i.e., not just Sears, Roebuck & Co. with near-instant gratification & better indexes

is moving a postal-based system to the Internet innovative? important, yes - but innovative?

IP Telephony or Internet Telephony?

"make sure it stays good"

"it is good enough"

ITU & others want to "define" voice over IP but no way to know what it *will* be

net his-47

"New" Networks

Sprint conversion to 'packet' technology (the quotes were in the Nortel 2001 press release) Verizon, SBC and BellSouth FTTH but what technology?

What Would Be Innovative?

how about Internet Telephony with

smart voice terminals
downloadable applications
open to the Internet
standard open protocols
actually this is not innovation
but would (does) enable innovation

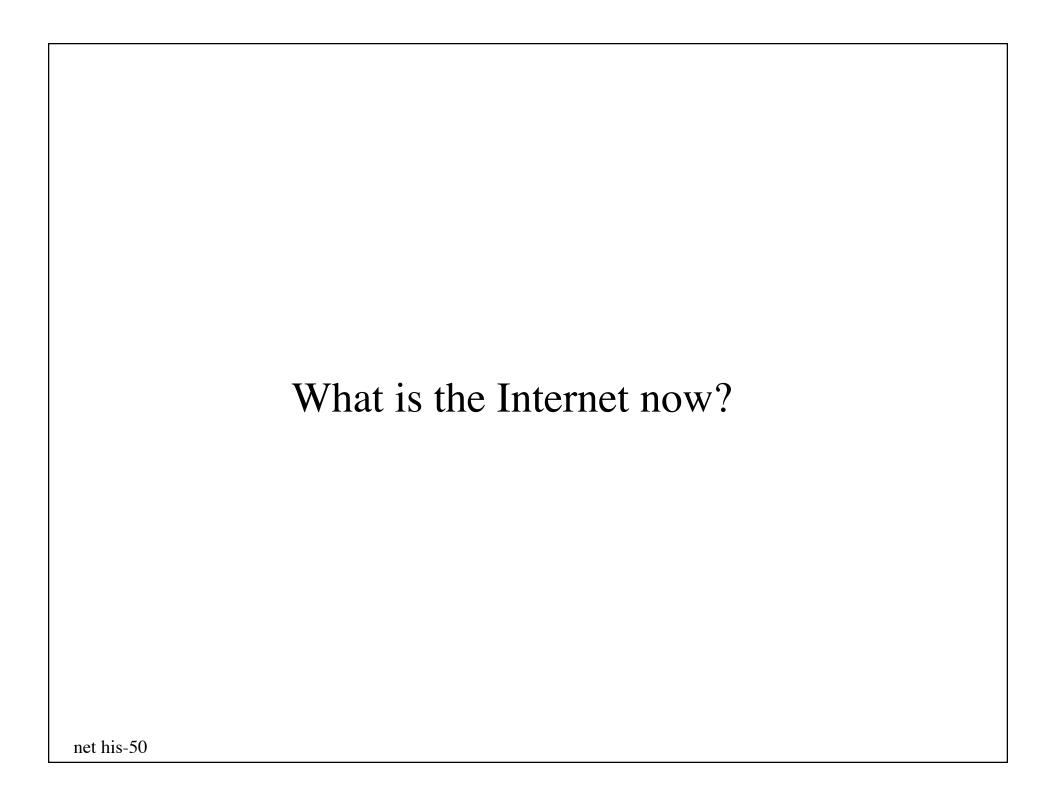

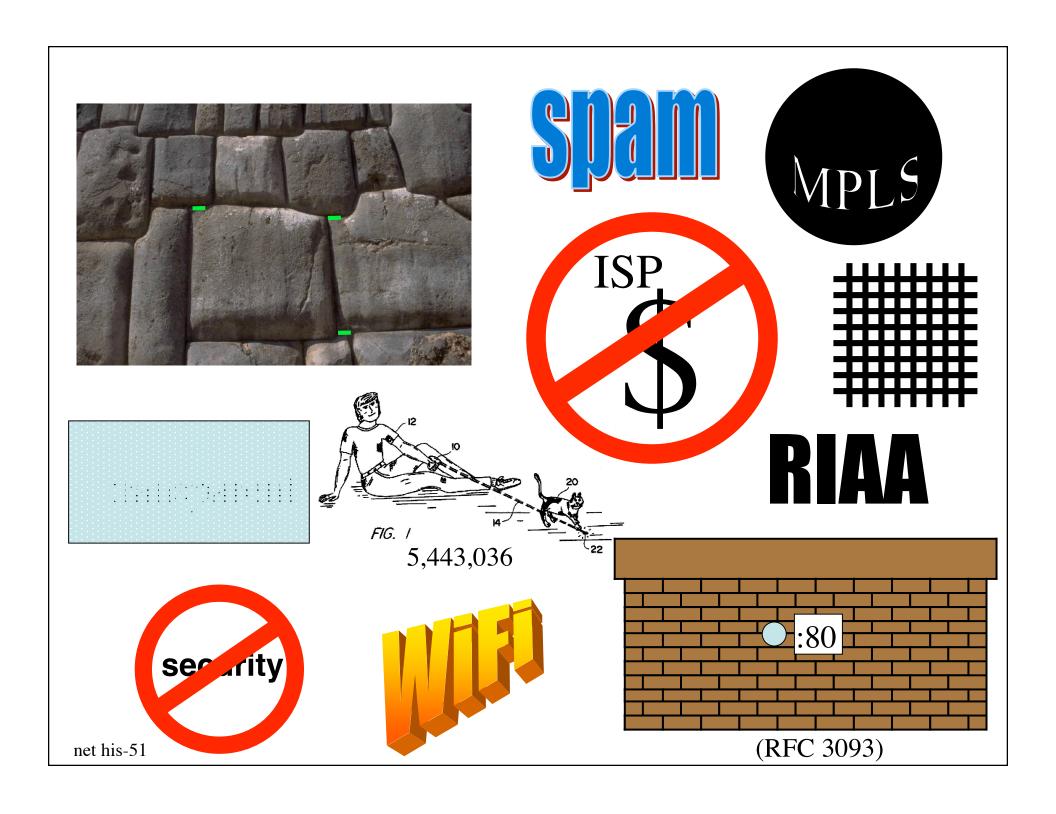

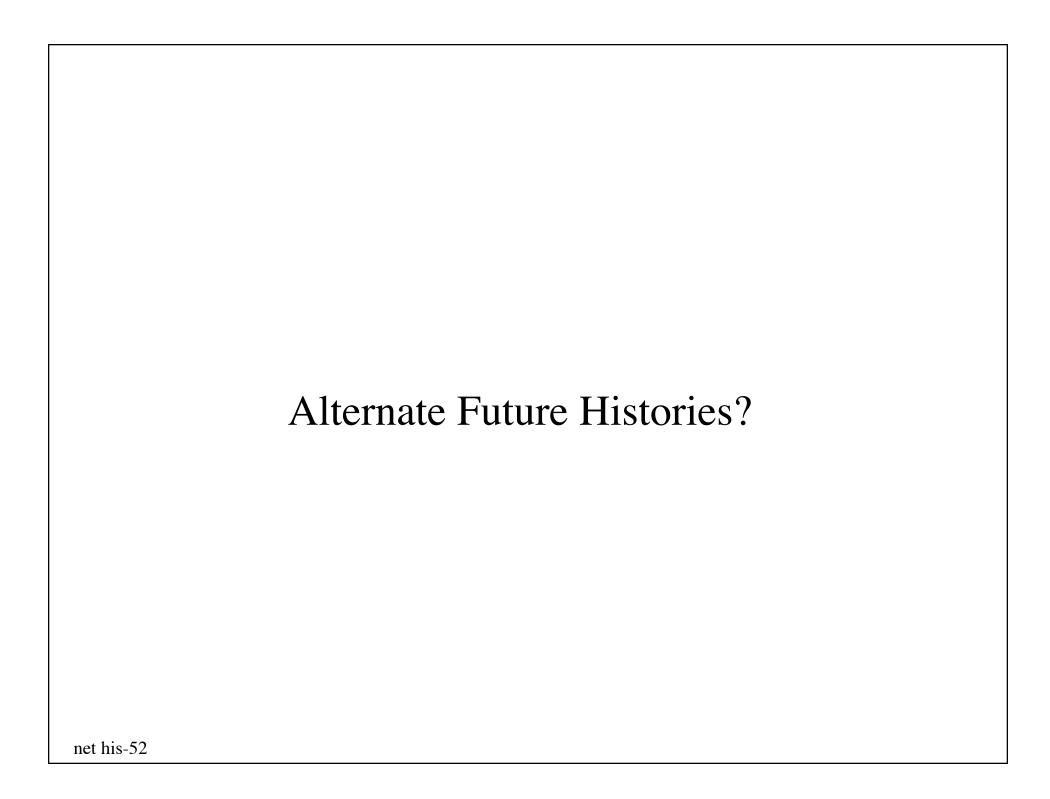

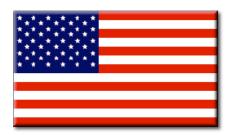

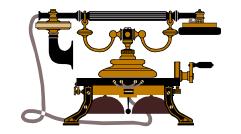

we built it so we own it!

far too important for the geeks

"make sure it stays good"

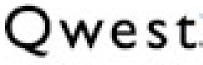

content

Spirit of Service™

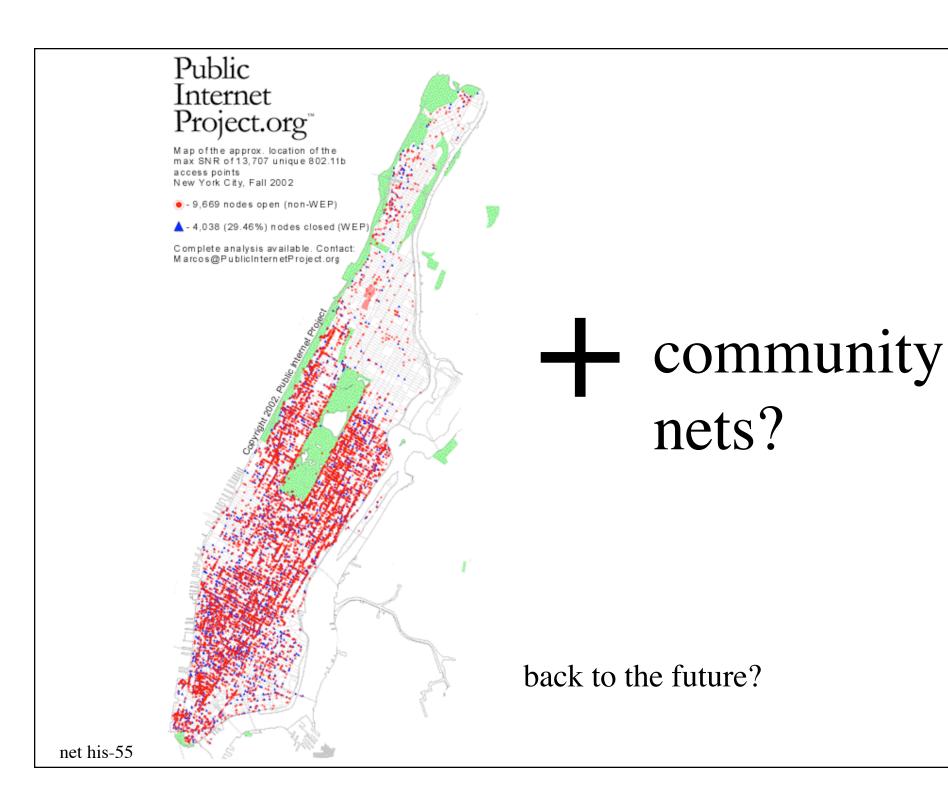

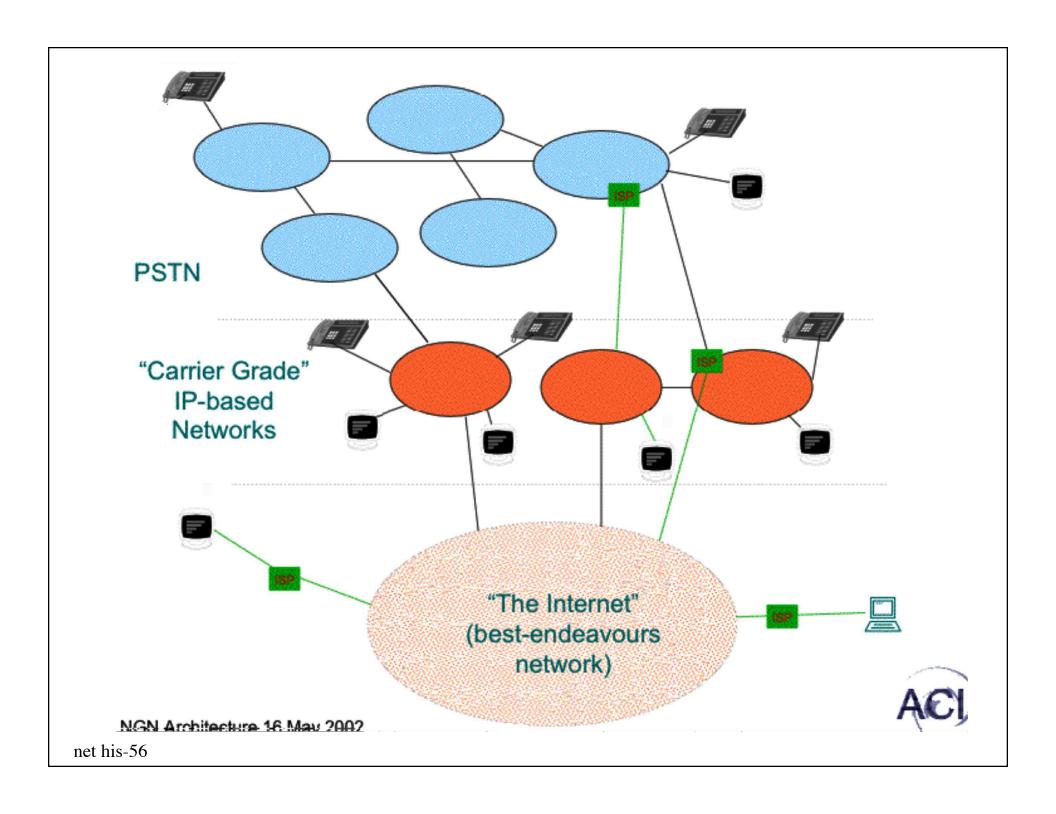

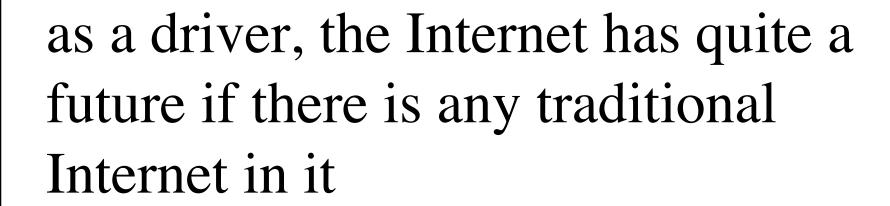

Then again the ISPs might survive to keep providing the Internet rather than a Disney-controlled

next time? (or is it now?)

support existing networks
datagram-based
creating the router function
split TCP and IP

decisions that made a difference

DARPA fund Berkeley to add TCP/IP to UNIX

CSNET and CSNET/ARPANET deal

NSF require TCP/IP on NSFnet

ISO turn down TCP/IP

NSF Acceptable Use Policy (AUP)

minimal regulation

Some Current Decisions

path openness
standards?
security
privacy
ISP business model
regulations

or

Key Open Questions

Who says who makes the rules?

Who says who pays for what?

watch out for WSIS answering these questions

it is NOW
(and it is us)
