

Continuous Integration and Continuous Delivery for Networks

Pete Lumbis - @PeteCCDE

Cumulus Networks Systems Engineer
CCIE #28677, CCDE 2012::3

Continuous Integration (CI):

A system where all changes are automatically tested before pushed to production or seen by others.

Continuous Integration (CI):

A system where all changes are automatically tested before pushed to production or seen by others.

Continuous Delivery (CD):

Built on a CI system where changes are made multiple times a day.

Continuous Integration (CI):

A system where all changes are automatically tested before pushed to production or seen by others.

Continuous Delivery (CD):

Built on a CI system where changes are made multiple times a day.

Not for everyone

WTF is CI/CD?

Continuous Integration (CI):

A system where all changes are automatically tested before pushed to production or seen by others.

Continuous Delivery (CD):

Built on a CI system where changes are made multiple times a day.

Behave Overview

```
plumbis:validation plumbis$ behave
Feature: Validate BGP # bgp.feature:1

  Scenario: Check BGP Neighbors # bgp.feature:3
    Given BGP is enabled # steps/bgp.py:219 1.760s
    When neighbors are configured # steps/bgp.py:243 0.001s
    Then the neighbors should be up # steps/bgp.py:341 0.000s

Feature: Validate Interfaces are up and IPs are applied # interfaces.feature:1

  Scenario: Check interfaces are up # interfaces.feature:3
    Given an interface is configured # steps/interfaces.py:156 1.889s
    Then the interfaces should be up # steps/interfaces.py:180 0.001s

Feature: Validate the webservers can be reached. # website.feature:1
  This will validate each server has apache2 configured and running.
  Then each server will try to reach every other server and fetch the index page
  Scenario: Validate Web Server Access # website.feature:5
    Given a webserver is configured # steps/website.py:225 0.596s
    When apache is running # steps/website.py:237 0.577s
    Then the website should be accessible # steps/website.py:245 4.564s

```
Feature: Validate BGP # bgp.feature:1
```

```
Scenario: Check BGP Neighbors      # bgp.feature:3
  Given BGP is enabled              # steps/bgp.py:219 1.777s
  When neighbors are configured     # steps/bgp.py:243 0.001s
  Then the neighbors should be up   # steps/bgp.py:341 0.000s
```

```
Feature: Validate Interfaces are up and IPs are applied # interfaces.feature:1
```

```
Scenario: Check interfaces are up  # interfaces.feature:3
  Given an interface is configured # steps/interfaces.py:156 1.947s
  Then the interfaces should be up  # steps/interfaces.py:180 0.001s
```

```
Feature: Validate the webservers can be reached. # website.feature:1
```

```
This will validate each server has apache2 configured and running.
Then each server will try to reach every other server and fetch the index page
```

```
Scenario: Validate Web Server Access # website.feature:5
  Given a webserver is configured    # steps/website.py:225 0.609s
  When apache is running             # steps/website.py:237 0.583s
  Then the website should be accessible # steps/website.py:245 5.181s
```

```
Assertion Failed: Error on server1 trying to access http://10.0.0.2 : Status code was not [200]: Request failed
: <urlopen error [Errno 101] Network is unreachable>
```

```
Failing scenarios:
```

```
website.feature:5 Validate Web Server Access
```
