

# DDoS Mitigation Tutorial

## NANOG 69

---

Krassimir Tzvetanov

# Introduction and overview

---

# Introduction

---

Who am I?

What is the target audience of this tutorial?

Let me know if I speak too fast!

Let's make it interactive!

# Overview

---

- Discuss what DDoS is, general concepts, adversaries, etc.
- What is currently fashionable?
- Go through a networking technology overview, in particular the OSI layers, sockets and their states
- Look at popular attack types at the different layers - DNS, NTP, SSDP reflection, SYN Flood
- Discuss reflection and amplification
- Mitigations

# What is DoS/DDoS?

---

# What is Denial of Service?

---

Resource exhaustion... which leads to lack of availability

Consider:

- How is it different from CNN pointing to somebody's web site?
- How is that different from company's primary Internet connection going down?

# What is Denial of Service?

---

From security point of view?

- Decreased availability

From operations point of view?

- An outage

From business point of view?

- Financial losses

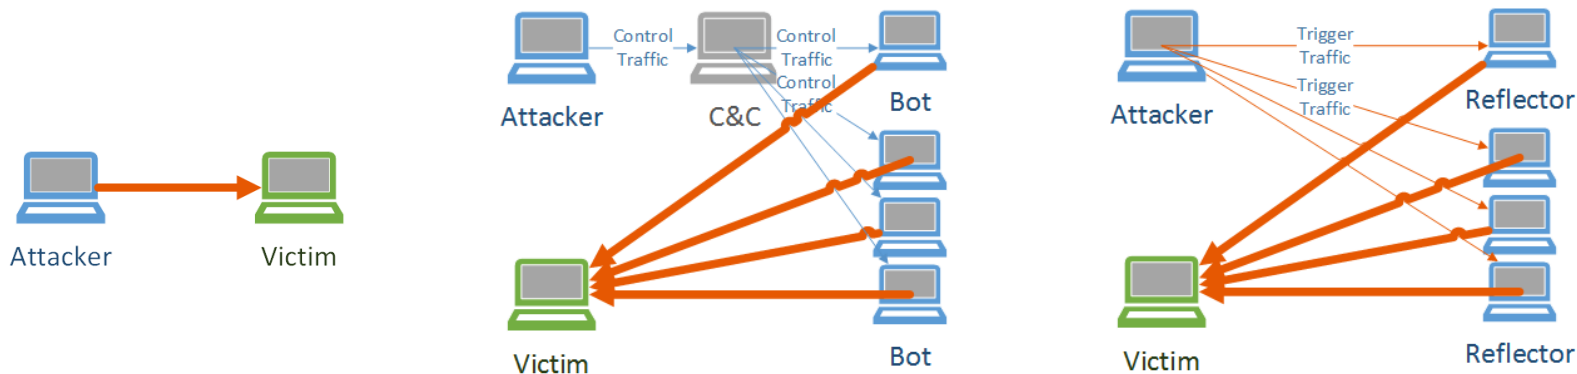

# DoS vs. DDoS

---

One system is sending the traffic vs many systems are sending the traffic

In the past it usually meant difference in volume

Over the past 3 years, due to reflective attacks, this has been changing rapidly

# The problem?

---

# Let's look at attack bandwidth

- Bandwidth in 2010 – little over 100 Gbps?
- 2013 – over 300 Gbps
- 2014 – over 400 Gbps
- Nowadays – irrelevant, it is all about bragging rights

Source: Arbor Networks Yearly Report

Figure 1  
Source: Arbor Networks, Inc.

# Contributing factors

---

- Embedded devices (mostly home routers)
- Available reflectors (DNS, NTP, SSDP)  
...with ability to amplify
- Outdated Content Management Systems (CMSes)
- Hosting providers allowing reflection
- More overall bandwidth available

# Embedded Devices (aka IoT)

---

- Home routers – increasing threat
  - Default passwords
  - Other vulnerabilities (NetUSB)
  - XBOX – attacks – Krebs' blog (re: 2014 XBOX/Play Station attacks)
  - Some do not allow the user to turn off DNS resolution
  - Network diagnostic tools

# Compromised CMSES

---

- Most targeted Content Management Systems:
  - WordPress
  - Joomla
- Started in early 2013
- Started with a particular group of people abusing it
- Now it is an easy way to build a botnet and other groups abuse it as well

# Economics considerations

---

How much does an attack really cost?

How much does the attacker pay per system?

Consider lack of other illegal activities profits

The life of a drone

- Financials related
- Spam related
- DDoS

How about IoT?

- Cost of ownership is low
- No financial gain (at this point)

# Who is the adversary?

---

# Adversary

---

Wide range of attackers

Gamers – on the rise!!! 😊

Professional DDoS operators and booters/stressors

Nation states

Hacktivists – not recently

...and more

# Motivation

---

Wide range of motivating factors as well

Financial gain

Extortion (Stealth Ravens/DD4BC/Armada Collective/copy cats)

Taking the competition offline during high-gain events

(online betting, Superbowl, etc).

Political statement

Divert attention (seen in cases with data exfiltration)

Immature behavior

# Skill level

---

## Wide range of skills:

- Depending on the role in the underground community
- Mostly segmented between operators and tool smiths
- Tool-smiths are not that sophisticated (at this point) and there is a large reuse of code and services
- This leads to clear signatures for some of the tools

## Increasing complexity:

- DirtJumper
- xnote.1
- XOR Botnet
- Mirai

# What is new(-ish)?

---

# What is new?

---

- Booters/Stressors (3 years)
- Embedded home and SOHO devices (3-4 years), Mirai added a new spin to it
- Content management systems – (5 years)

# Booters/Stressors

---

- Inexpensive
- Tools are sold for cheap on the black market (forums)
- Range 5-10 Gbps and up to 40GBps
  - over the past years there were mentions of 80GBps (but not conclusive)
- Usually short duration
- Popular among gamers

# Booters/Stressors

---

- A picture is worth a thousand words:
  - Think about the audience they are trying to attract
- Google: “Gwapo’s Professional DDOS”

# Home routers

---

- Embedded home and SOHO devices
  - Default username/password
  - Open DNS recursive resolvers
  - NetUSB bug
  - Network diagnostic tools
  - Some do not allow the user to turn off DNS
- XBOX and Sony attacks over Christmas (2014)
  - Krebs on security:  
<http://krebsonsecurity.com/2015/01/lizard-stresser-runs-on-hacked-home-routers/>
- Is that intentional?

# Technology and Terminology Overview

---

# Technology Overview

---

The purpose of this section is to level set

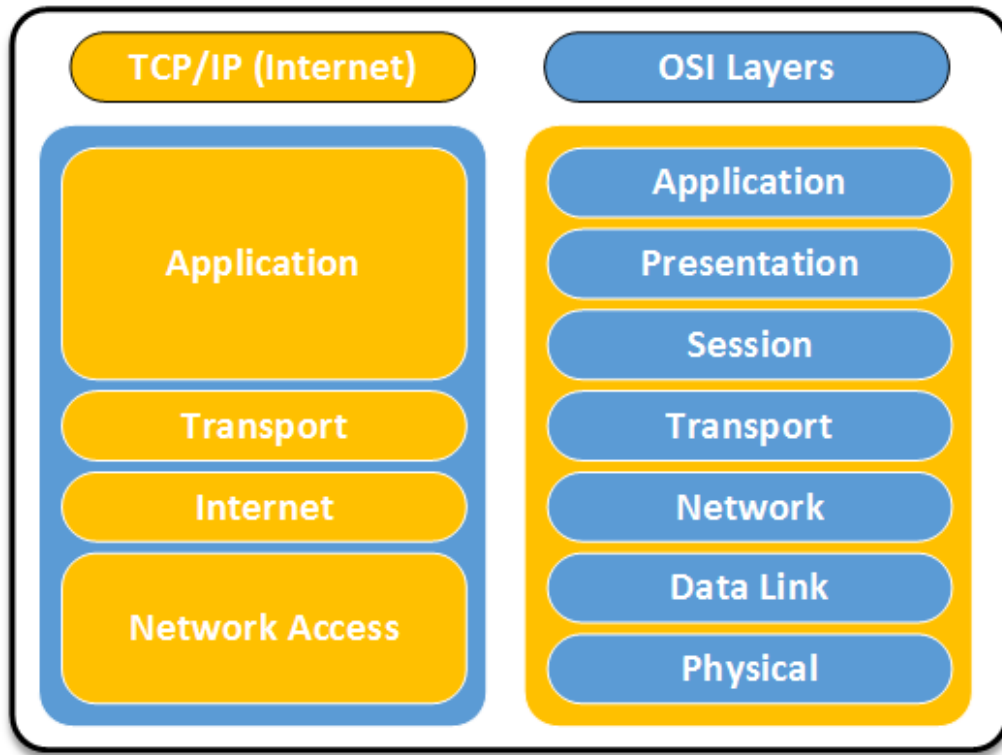

Topics we'll cover

- OSI and Internet models
- TCP and sockets
- DNS operation and terminology
- NTP, SNMP, SSDP operation
- Some terminology and metrics

# Network Layers

---

OSI – Open  
Systems Interconnect

# Physical and Data-link Layers (L1 and L2)

---

Aka: Network Access Layer

## Physical

Media changes that carry information: voltage, phase

Line coding: Manchester, NRZ, NRZ-I

Data unit: bit

## Data-link

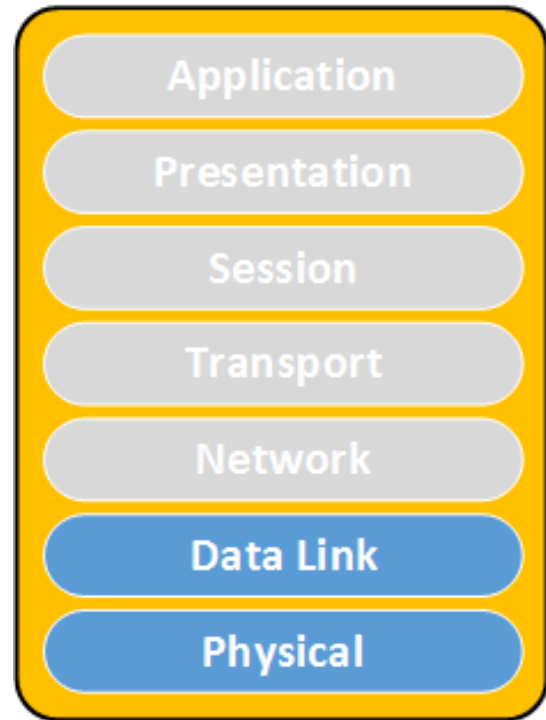

Data unit: frame (organizes bits in a frame)

Provides physical addressing on a local network segment

Separate in two:

Media Access Control Layer (MAC): 802.3, 802.4, 802.5, 802.11abe

Logical-link Control: 802.2

# Network Layer (layer 3)

---

Aka Internet Layer

Provides transport of data units between two points in the network

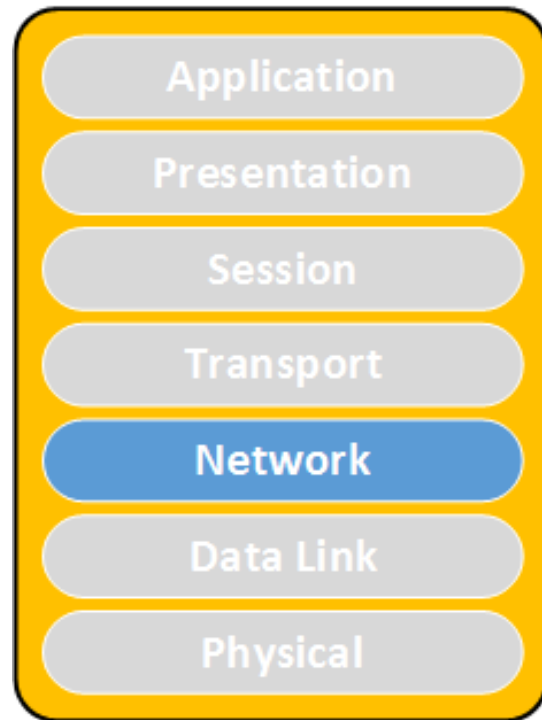

Provides logical (and global) addressing of machines in the network

Data unit: Packet

Examples: Internet Protocol (IP)

Does not guarantee delivery

Allows for fragmentation

# Transport Layer (layer 4)

---

Aka Transport (hey, this one matches the Internet model!) 😊

Provides logical connection between applications

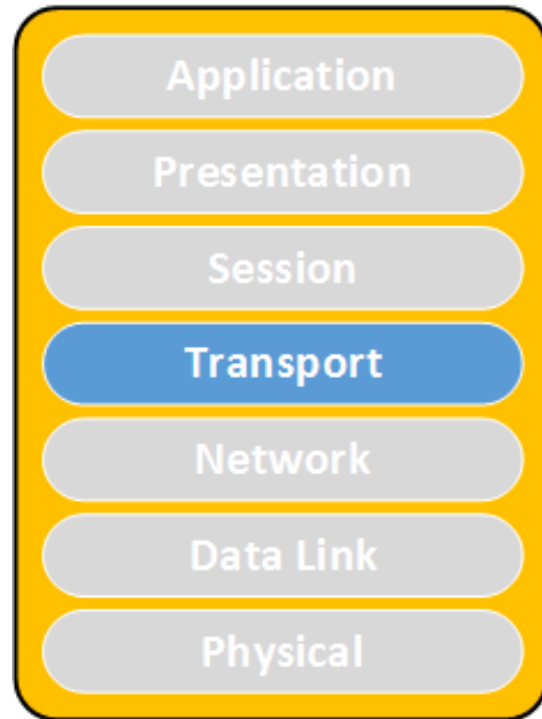

Provides addressing of applications on a single system (via port numbers)

Data unit: segment

In some modalities like TCP provides virtual circuit and ensures data ordering and no loss of packets

Typical for TCP is the 3-way handshake

Examples: TCP, UDP

# Session Layer (layer 5)

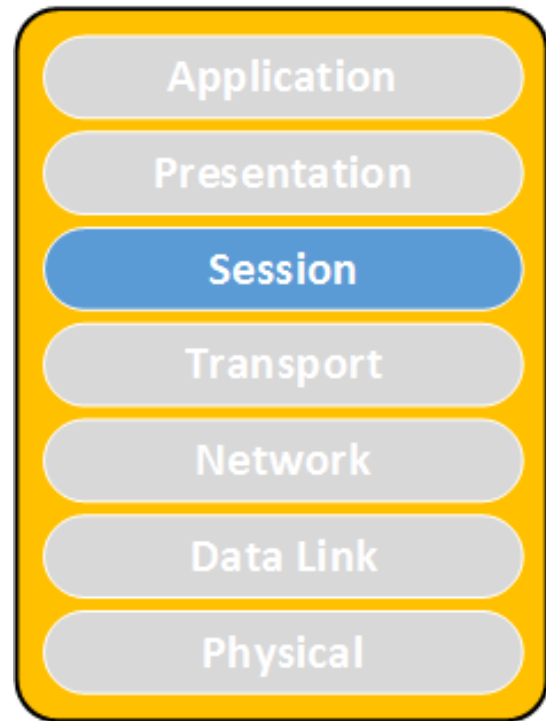

---

Part of the Internet model Application layer

Managing sessions between application (think state, like authentication)

Examples: HTTP, SMTP, NetBIOS

Addressing: some protocols provide logical endpoint

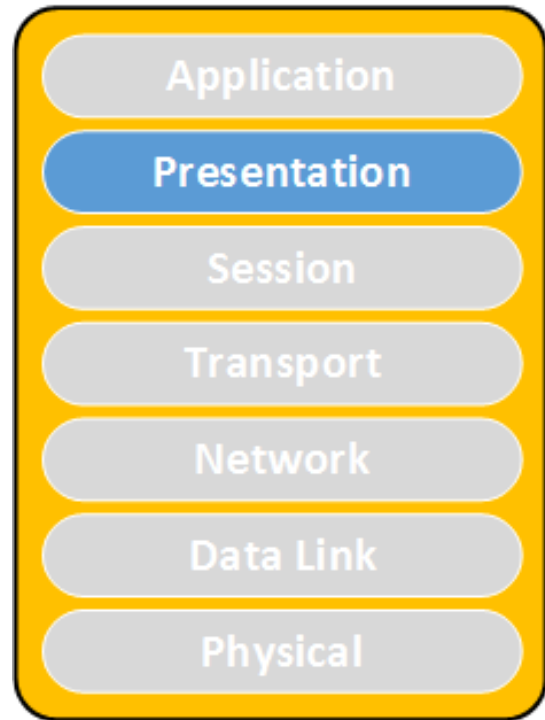

# Presentation Layer (layer 6)

---

Part of the Internet model Application layer

Provides uniform data representation across multiple architectures and platforms

Examples: images, file encryption

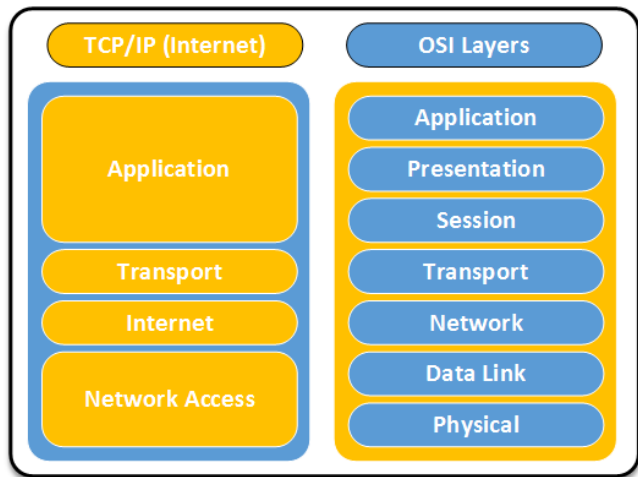

# Application Layer (layer 7)

---

This is where the application lives

Part of the Internet model  
Application layer

# Questions?

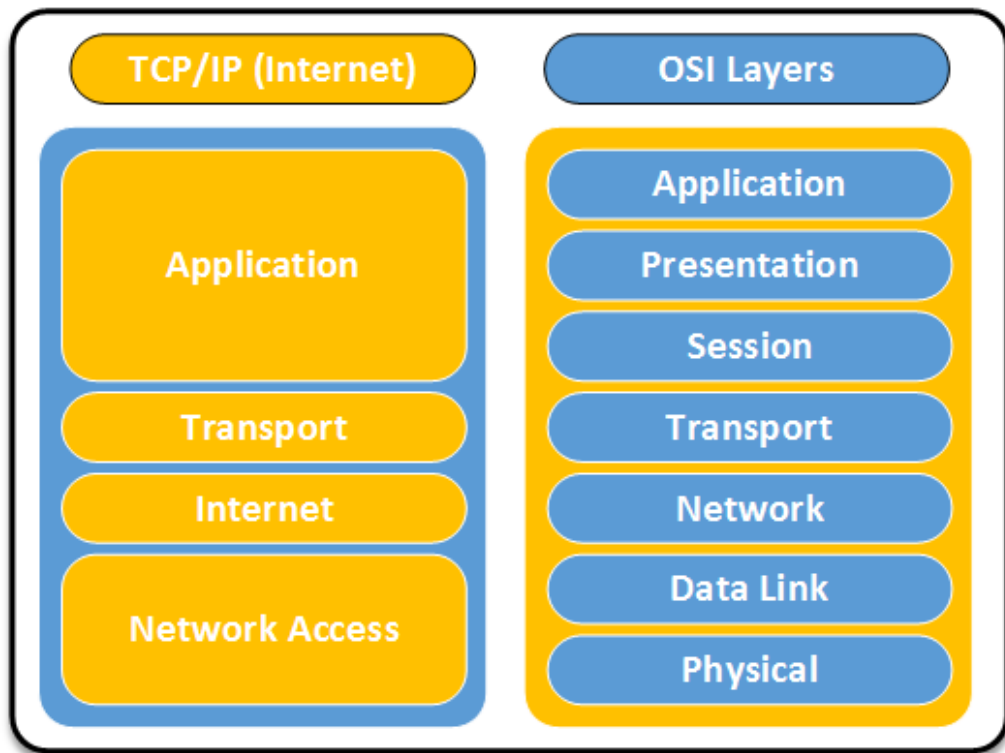

---

# Attack surface

---

# Network Layers – OSI vs Internet Model

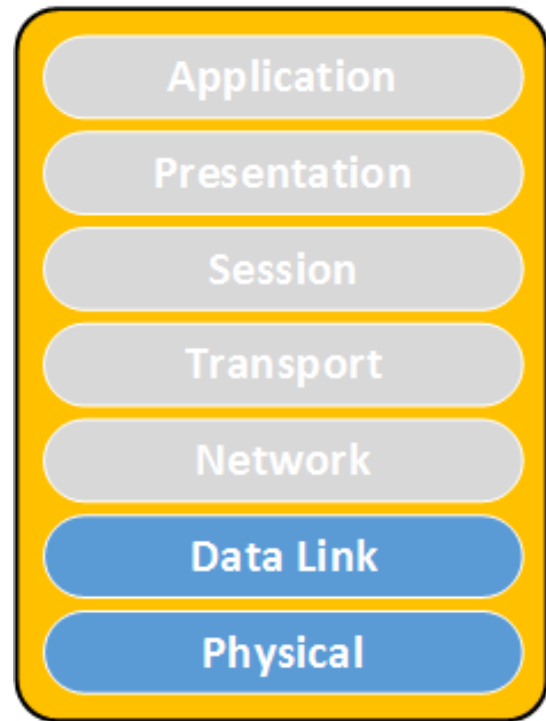

---

# Physical and Data-link Layers

---

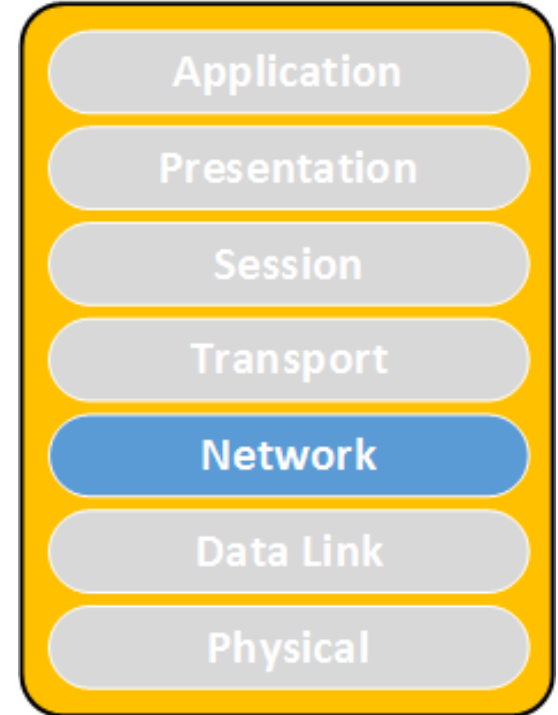

- Cut cables
- Jamming
- Power surge
- EMP
  
- MAC Spoofing
- MAC flood

# Network Layer

---

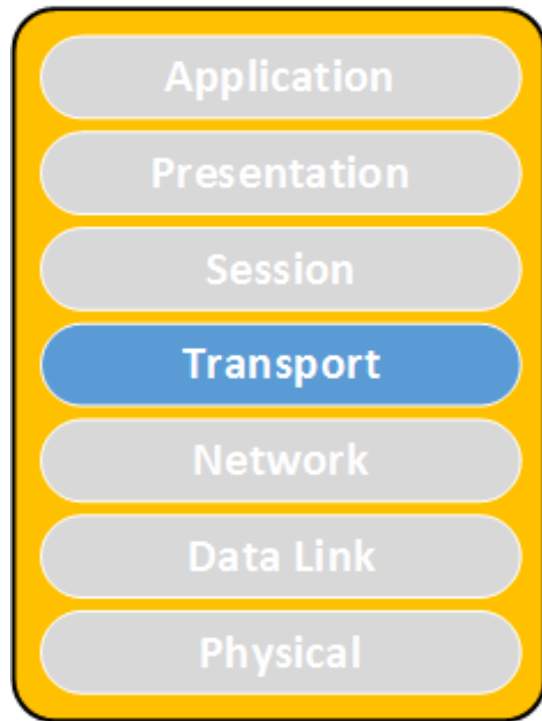

- Floods (ICMP)
- Teardrop  
(overlapping IP segments)

# Transport Layer

---

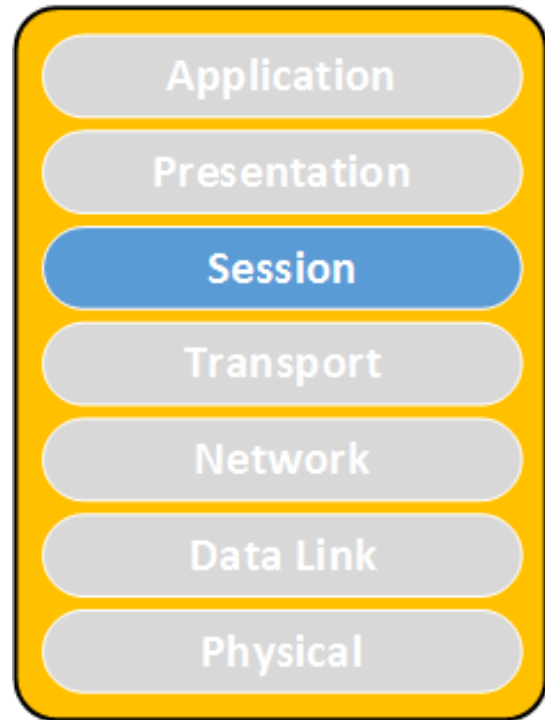

- SYN Flood
- RST Flood
- FIN Flood
- You name it...
  
- Window size 0  
(looks like Slowloris)
- Connect attack
- LAND (same IP as src/dst)

# Session Layer

---

- Slowloris
- Sending data to a port with no NL in it (long headers, long request lines)
- Send data to the server with no CR

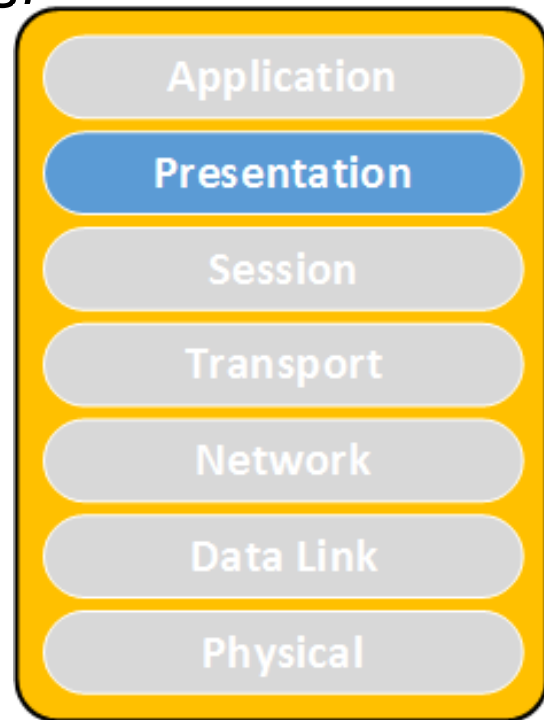

# Presentation Layer

---

- Expensive queries (repeated many times)

- XML Attacks

```
<!DOCTYPE lolz  
[  
  <!ENTITY lol1 "&lol2;">  
  <!ENTITY lol2 "&lol1;">  
]>  
<lolz>&lol1;</lolz>
```

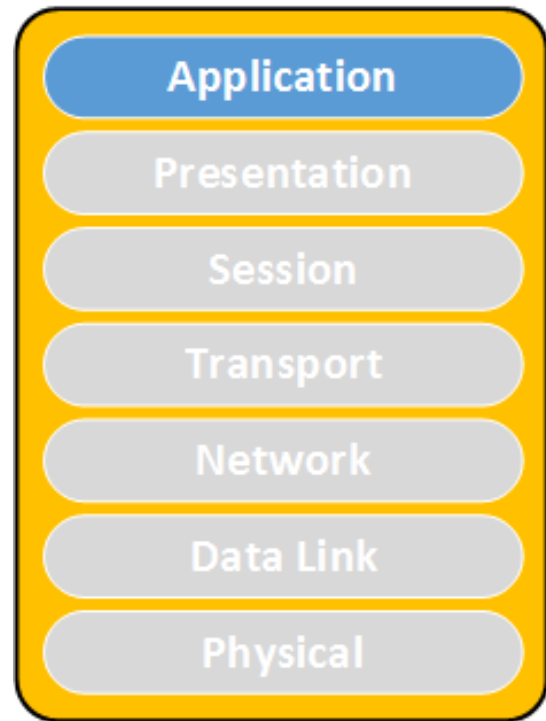

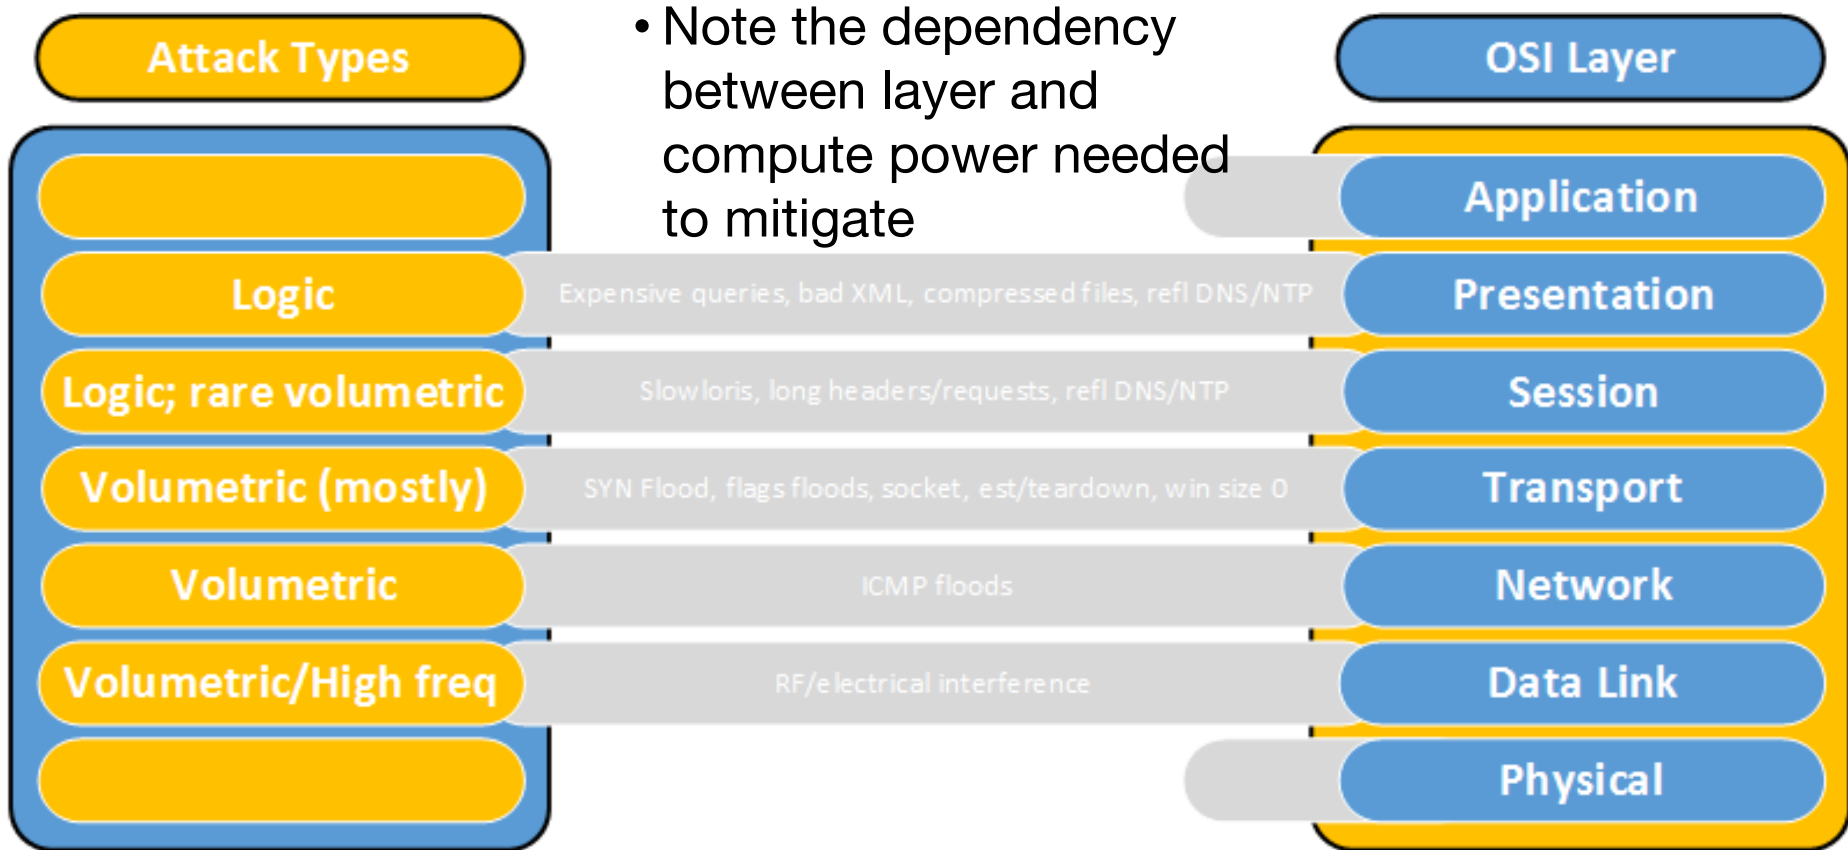

# Application Layer

---

- Depends on the application
- Black fax

# Attack summary by layer

# Questions?

---

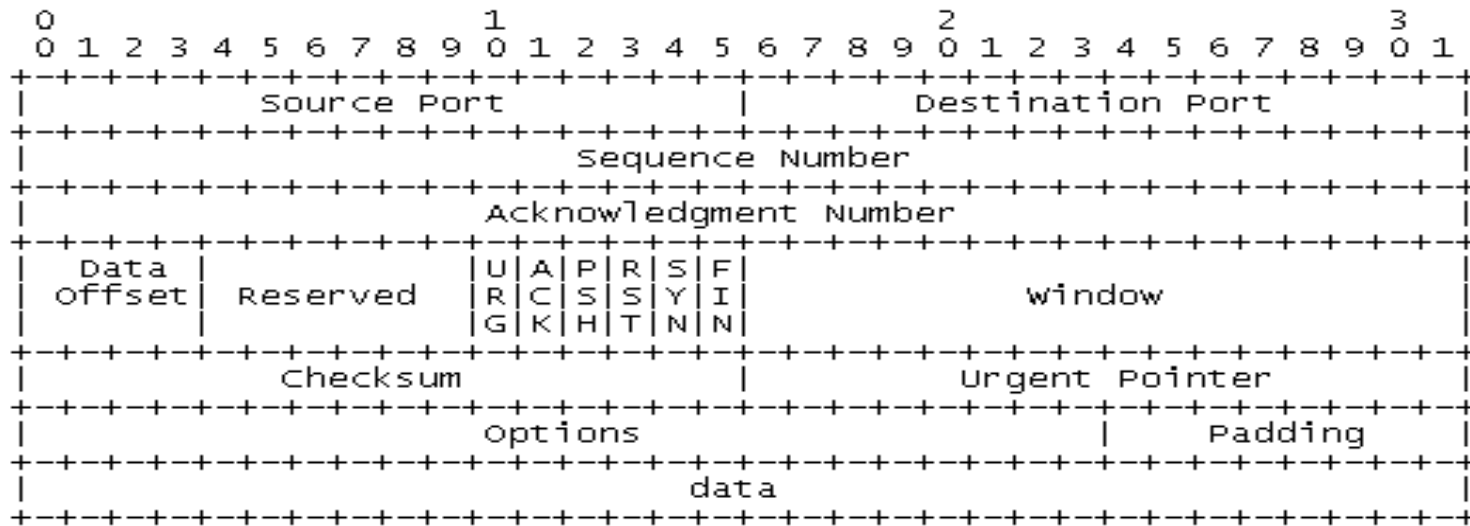

# Transmission Control Protocol (TCP) and sockets

---

# Introduction to TCP

- Provides end-to-end virtual circuit
- Manages data loss detection and retransmission
- Deals with datagram ordering

RFC: 793 / September 1981  
TRANSMISSION CONTROL PROTOCOL

# Sockets

---

Socket is an abstraction allowing an application to bind to a transport layer address (aka network port)

It is described by a state machine

Throughout its life time it goes through a number of states

# Socket States

---

Here are some of the socket states of importance:

CLOSED – start state

LISTEN – waiting for a connection request

SYN\_SENT – initiated a connection

SYN\_RECV – received request still negotiating

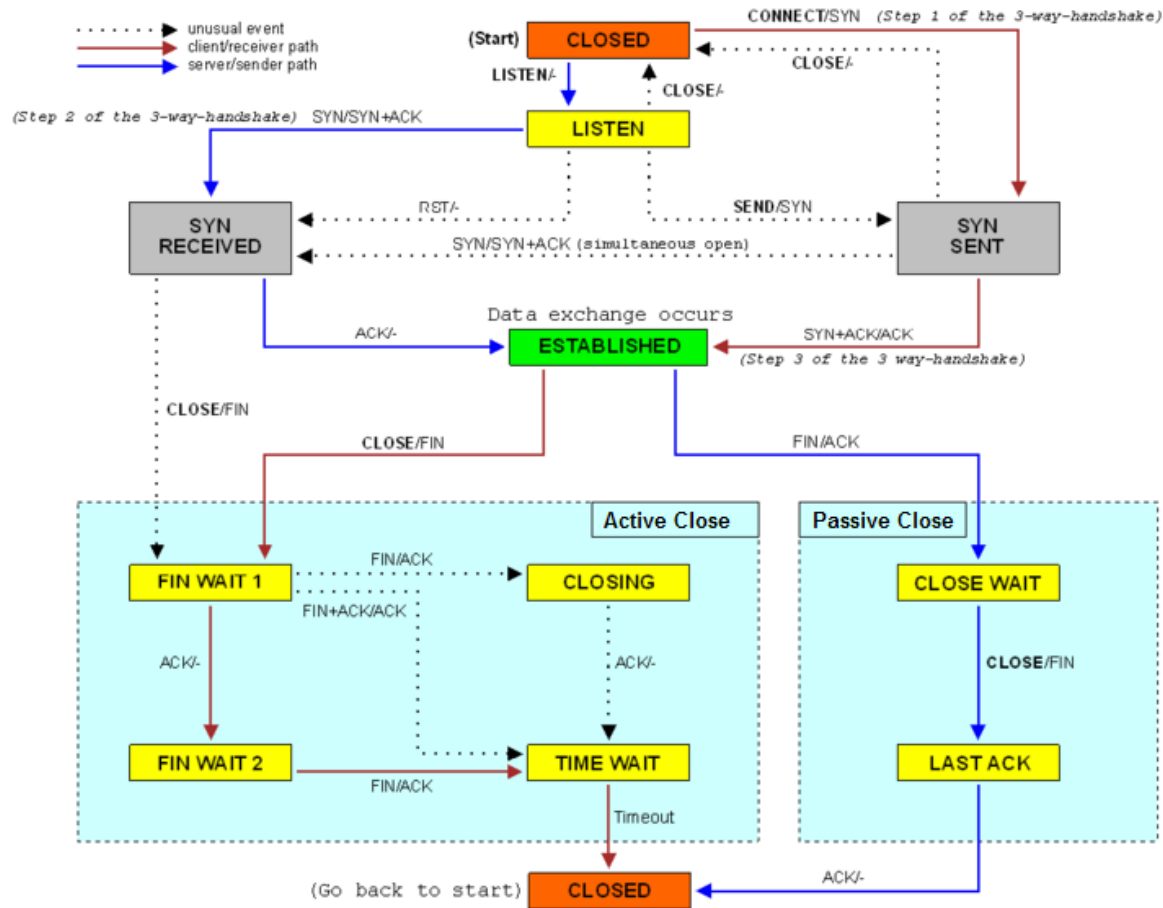

ESTABLISHED – connection working OK

CLOSE\_WAIT – waiting for the application to wrap up

FIN-WAIT1/2, CLOSING, LAST\_ACK – one side closed the connection

TIME\_WAIT – waiting for 2 x MSL

## NANOG 69: DDoS Tutorial

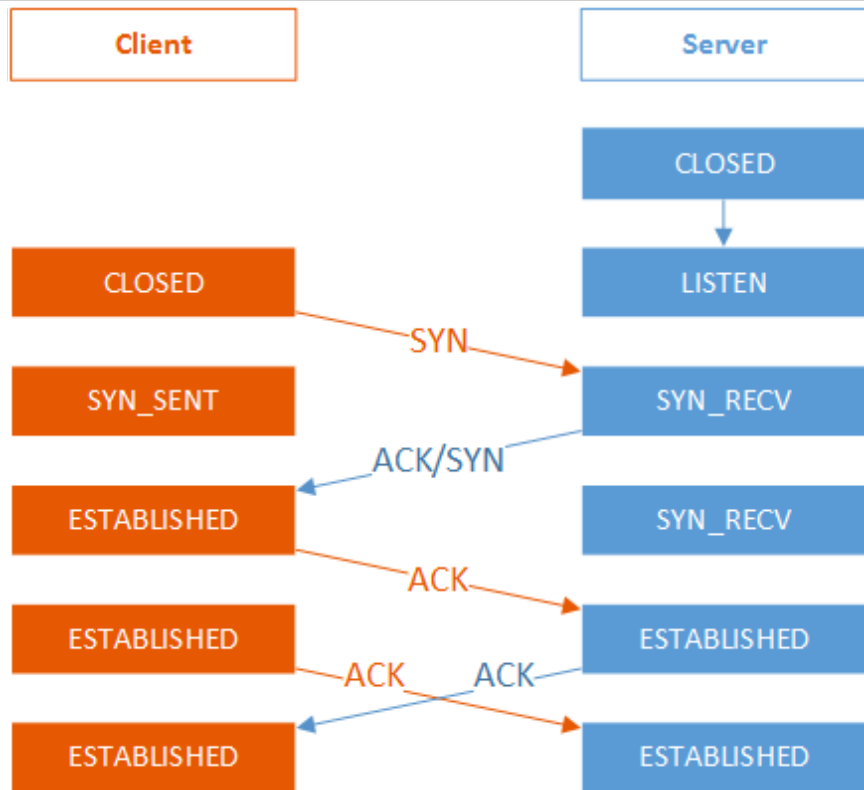

# Opening a TCP connection

## Let's review the sequence for opening a connection

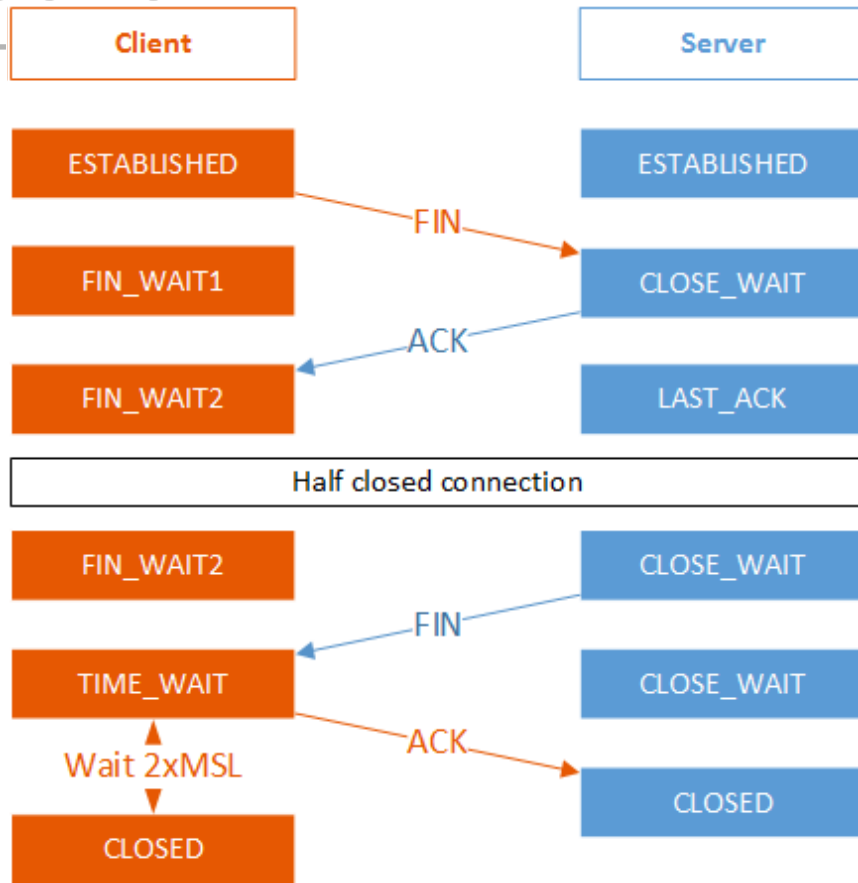

- Server side opens a port by changing to LISTEN state
- Client sends a SYN packet and changes state to SYN\_SENT
- Server responds with SYN/ACK and changes state to SYN\_RECV. For the client this is ESTABLISHED connection
- Client has to ACK and this completes the handshake for the server
- Packet exchange continues; both parties are in ESTABLISHED state

# Closing a TCP connection

## Sequence for closing a connection

- Both parties are in ESTABLISHED state
- One side initiates closing by sending a FIN packet and changes state to FIN\_WAIT1; this changes the other side to CLOSE\_WAIT
- It responds with ACK and this closes one side of the connection
- We are observing a half closed connection
- The other side closes the connection by sending FIN
- And the first side ACKs
- The first side goes into a wait for 2 times the MSL time (by default 60 seconds)

# Use of netstat for troubleshooting

---

```
[root@knight ghost]# netstat -nap | grep 12345
```

```
tcp      0      0 0.0.0.0:12345          0.0.0.0:*              LISTEN    2903/nc
```

```
[root@knight ghost]# netstat -nap | grep 12345
```

```
tcp      0      0 127.0.0.1:12345        127.0.0.1:49188        ESTABLISHED 2903/nc
```

```
[root@knight ghost]# netstat -nap | grep 12345
```

```
tcp      0      0 127.0.0.1:49188        127.0.0.1:12345        TIME_WAIT -
```

```
[root@knight ghost]# netstat -nap | grep 12345
```

```
[root@knight ghost]#
```

# Attack types and terminology

---

# Attack classification classifications

---

(pun intended) ;)

- By volume
  - Volumetric
  - Logic/Application
- Symmetry
  - Asymmetric
  - Symmetric
- Direction
  - Direct
  - Reflected

- Source
  - Single source
  - Distributed
- State change
  - Permanent
  - Recoverable
- Based on network layer

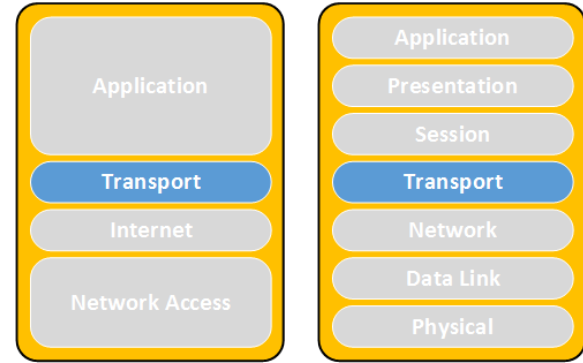

# Important metrics and what to report

---

- Bandwidth (Kbps, Gbps)
- Latency
- PPS
- QPS
- Storage
- CPU
- Application specific – usually latency
- Protocol

# Attack type details

---

# SYN Flood

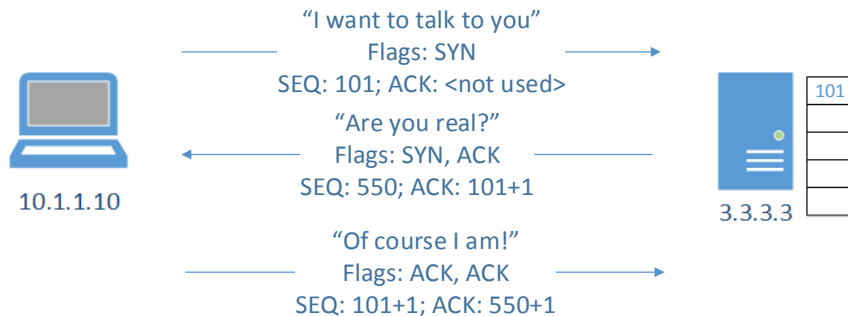

---

# What is a SYN flood?

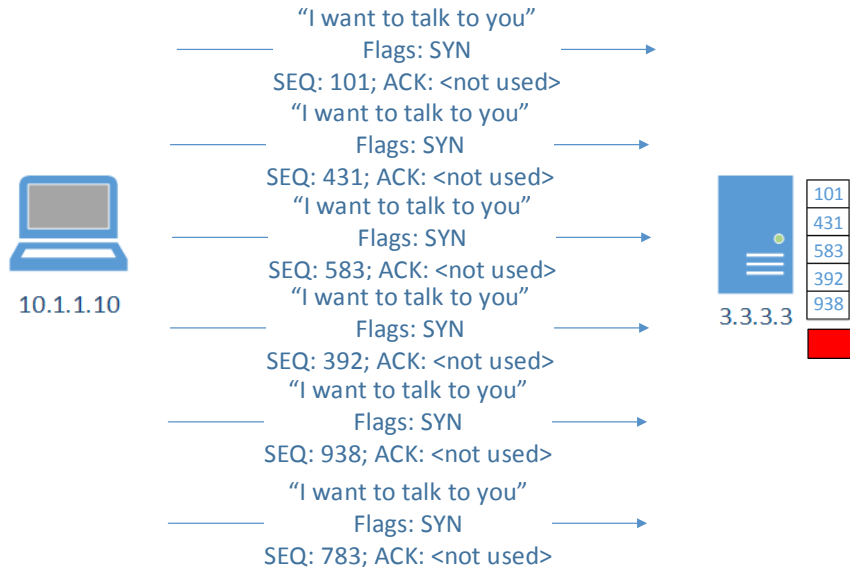

---

## What is a 3-way handshake?

# SYN flood

- Exploits the limited slots for pending connections
- Overloads them

# SYN flood through the eyes of netstat

---

netstat -anp

Active Internet connections (servers and established)

Proto	Recv-Q	Send-Q	Local Address	Foreign Address	State	PID/Program name

```

Attacker  
Random IP address/  
port

Target  
127.0.0.1:80

Pay attention to the  
SYN flag!

# SYN flood mitigation

---

- Technology
- SYN Cookies
- Whitelists
- TCP Proxy (TCP Intercept – active mode)
- TCP Resets (TCP Intercept – passive)
- Nowadays – volumetric

# What is a SYN cookie?

---

Hiding information in ISN (initial sequence number)

SYN Cookie:

**Timestamp % 32 + MSS + 24-bit hash**

Components of 24-bit hash:

server IP address

server port number

client IP address

client port

timestamp >> 6 (64 sec resolution)

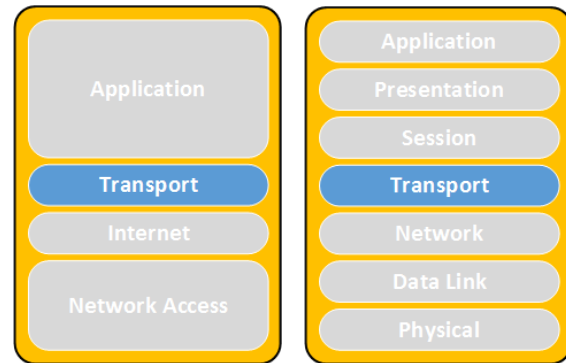

# Enabling SYN-cookies

---

- To enable SYN cookies:

```
echo 1 > /proc/sys/net/ipv4/tcp_syncookies
```

- All TCP related settings are located in `/proc/sys/net/ipv4/`
  - `tcp_max_syn_backlog`
  - `tcp_synack_retries`
  - `tcp_syn_retries`

# Socket Exhaustion

---

# Socket Exhaustion

---

What is a socket?

What is Maximum Segment Lifetime (MSL)?

How old is the Internet?

What is Time To Live (TTL) measured in?

What is socket exhaustion?

# Socket Exhaustion observed via netstat

---

Socket exhaustion would look like this:

Active Internet connections (servers and established)

Proto	Recv-Q	Send-Q	Local Address	Foreign Address	State	PID/Program name
tcp	0	0	0.0.0.0:111	0.0.0.0:*	LISTEN	1339/rpcbind
tcp	0	0	0.0.0.0:33586	0.0.0.0:*	LISTEN	1395/rpc.statd
tcp	0	0	192.168.122.1:53	0.0.0.0:*	LISTEN	1962/dnsmasq
tcp	0	0	127.0.0.1:631	0.0.0.0:*	LISTEN	1586/cupsd
tcp	0	0	127.0.0.1:25	0.0.0.0:*	LISTEN	2703/sendmail: acce
tcp	0	0	0.0.0.0:1241	0.0.0.0:*	LISTEN	1851/nessusd: waiti
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60365</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60240</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60861</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60483</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60265</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60618</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60407</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60423</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60211</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60467</b>	<b>TIME_WAIT</b>	<b>-</b>
<b>tcp</b>	<b>0</b>	<b>0</b>	<b>127.0.0.1:25</b>	<b>127.0.0.1:60213</b>	<b>TIME_WAIT</b>	<b>-</b>

# How to enable socket reuse (IoT issue)

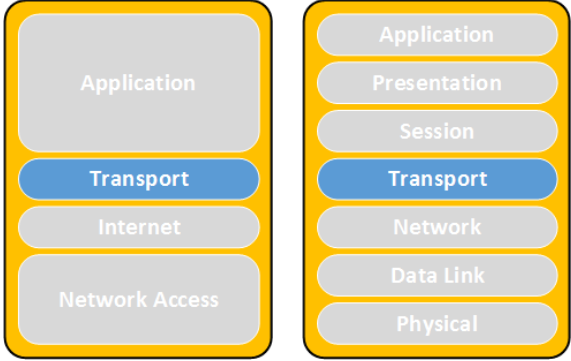

---

- How to determine

```
cat /proc/sys/net/ipv4/tcp_fin_timeout  
sysctl net.ipv4.tcp_fin_timeout
```

- Enable socket reuse

```
echo 1 > /proc/sys/net/ipv4/tcp_tw_recycle  
echo 1 > /proc/sys/net/ipv4/tcp_tw_reuse
```

# Slowloris

---

# Connection handling architectures

---

Process based connection handling?

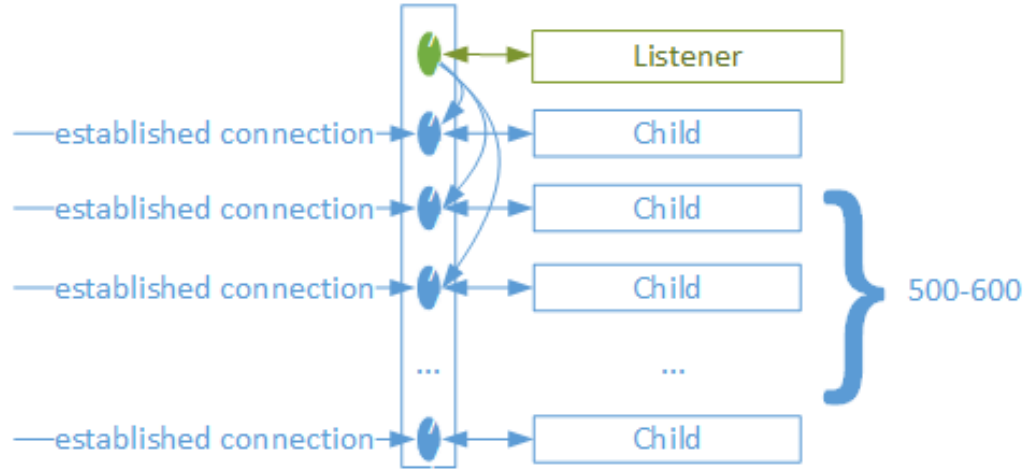

Think “Apache”

Event based connection handling?

Think “nginx”

# Process oriented explained

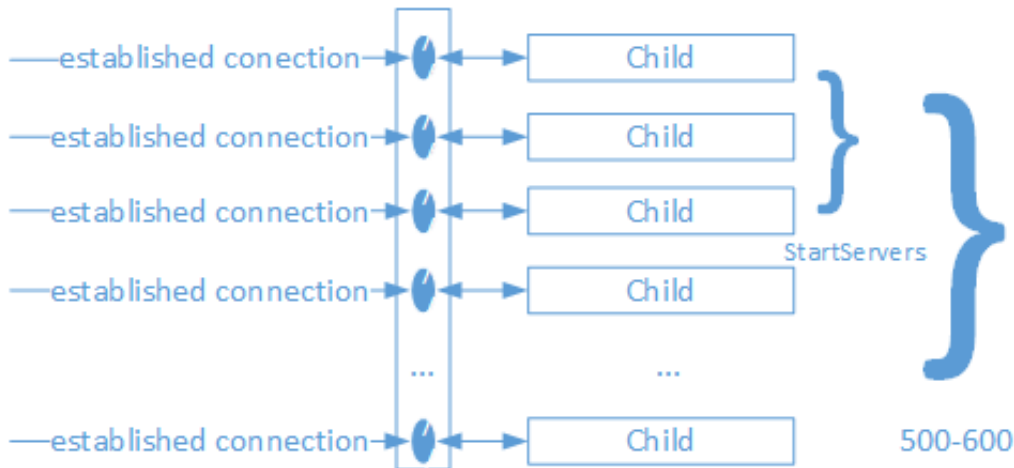

- Listener opens sockets
- New connection comes in
- Process forks; separate process handles the connection
- New connection comes in
- Process forks; separate process handles the connection
- ...and so on...
- ...usually with up to 500-600 concurrent process copies

# Apache web server (simplified)

---

- Few child processes listen on a socket
- A new connection comes in...
- ...and one of them takes it
- Another new connection comes in...
- ...and the next one takes it.
- Pool is exhausted; new processes are spawned (forked)
- ...and so on...
- Up to about 500-600
- The initial set is defined by StartServers

# Nginx (simplified)

- Master Process controls logistics
- Support processes (cache management)
- Worker processes process connections
- One or more...
  - ...one per core
- Each worker can handle many sockets concurrently
- A new connection comes in
  - ...and is established; no `dup()`
  - ...and so on...

# Slowloris

---

- Exploits the process based model but opening a number of concurrent connections and holds them open for as long as possible with the least amount of bandwidth possible

# Slowloris request

---

Request:

send: GET /pki/crl/products/WinPCA.crl HTTP/1.1

wait...

send: Cache-Control: max-age = 900

wait...

send: Connection: Keep-Alive

wait...

send: Accept: \*/\*

wait...

send: If-Modified-Since: Thu, 06 Aug 2015 05:00:26 GMT

wait...

send: User-Agent: Microsoft-CryptoAPI/6.1

wait...

send: Host: [crl.microsoft.com](http://crl.microsoft.com)

# Slowloris illustrated

- The client opens a connection and sends a request...
- ...then another...
- ...and another...
- ...and so on.
- ...and waits some time...
- ...and sends the next header
- ...and so for each connection
- ...and so on...

# Slowloris mitigation

---

- Change of the software architecture
- Use of event driven reverse proxy to protect the server (like nginx)
- Dedicated hardware devices

# Questions?

---

# Reflection and amplification attacks

---

# Two different terms

---

- Reflection  
using an intermediary to deliver the attack traffic
- Amplification  
ability to deliver larger response than the trigger traffic

# Reflection

---

# Reflective attacks

---

- Attacks where the an unwilling intermediary is used to deliver the attack traffic
- The attacker would normally send a packet with a forged source IP address to the intermediary. The forget address is going to be the one of the target. The intermediary will deliver a response which will go to the target instead of the attacker

Note to audience: think what protocols we can use for that?

# What is reflection(ed) attack

---

Attacks where the an unwilling intermediary is used to deliver the attack traffic

Attacker sends a packet with a spoofed source IP set to the victim's  
Reflectors respond to the victim

# Reflector types

---

The ones that are of interest are:

- DNS
- NTP
- SSDP
- SNMP
- RPC (reported lately but not really large)

# Amplification

---

# What is amplification attack?

---

- Asymmetric attack where response is much larger than the original query

# Amplifiers types

---

The ones that are of interest and provide amplifications are:

- DNS
- SSDP
- NTP
- SNMP

**Amplification factors:**

<https://www.us-cert.gov/ncas/alerts/TA14-017A>

# Amplification quotients

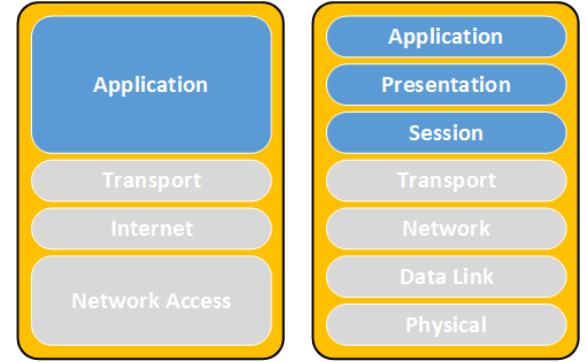

Protocol	Bandwidth Amplification Factor	Vulnerable Command
DNS	28 to 54	Multiple
NTP	556.9	Multiple
SNMPv2	6.3	GetBulk request
NetBIOS	3.8	Name resolution
SSDP	30.8	SEARCH request
CharGEN	358.8	Character generation request
QOTD	140.3	Quote request
BitTorrent	3.8	File search
Kad	16.3	Peer list exchange
Quake Network Protocol	63.9	Server info exchange
Steam Protocol	5.5	Server info exchange

- Source: US-CERT: <https://www.us-cert.gov/ncas/alerts/TA14-017A>

# Questions?

---

# DNS Resolution

---

# DNS server types

---

- Authoritative

The source of truth for a particular domain name

Example: Root DNS servers, .com DNS server, .google.com DNS server, etc.

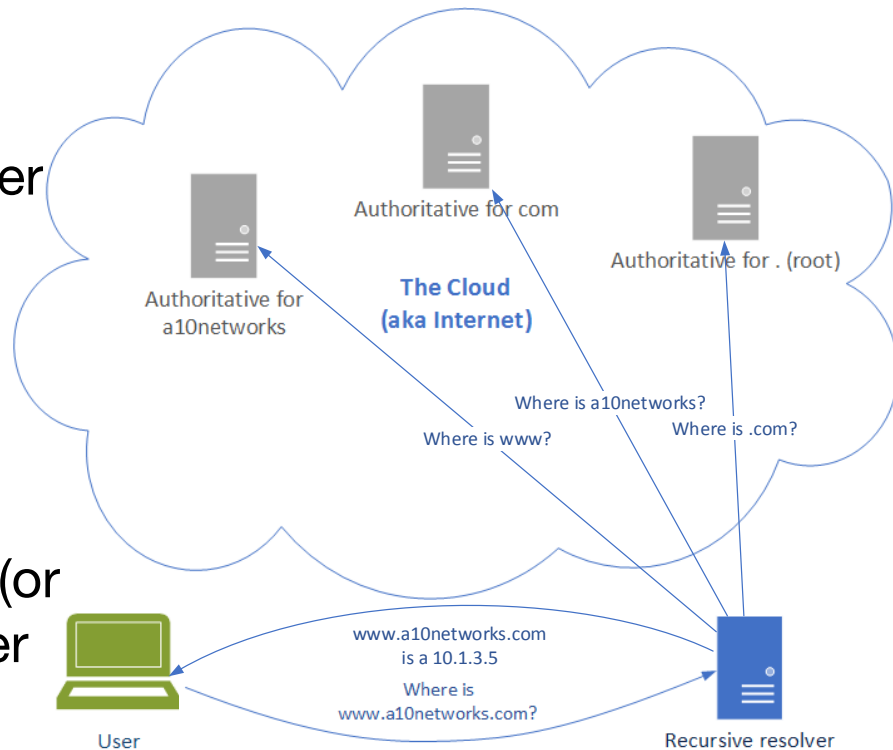

- Recursive

Service endpoints; optimize the DNS queries

Example: corporate DNS server, home router DNS server

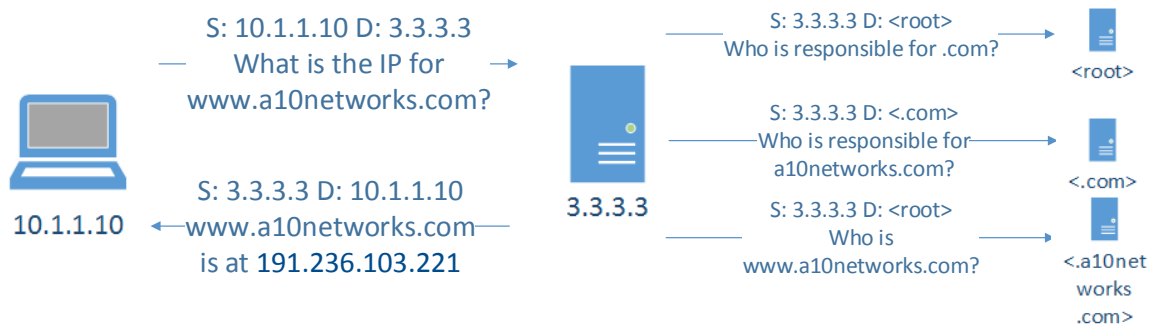

# DNS resolution

- How does DNS work?
- User talks to recursive resolver
- The recursive goes on the Internet and talks to the authoritative servers
- When an answer is obtained (or not) it reports back to the user

# DNS resolution at the packet level

- The process of mapping:  
`www.fastly.com => 151.101.117.57`

...if the answer  
was cached

# DNS Reflection

---

# What is DNS reflection attack?

---

- What happens if an attacker forges the victim address as its source?

...the reflected traffic goes to the target server

... and what if hundreds of misconfigured open DNS resolvers are used?

# Consider this query

---

- Triggered by something like:
  - `dig ANY isc.org @3.3.3.3`
- Example: `~$ dig ANY isc.org @172.20.1.1 # My home lab`
  - Flip over for answer

# Consider this (cont'd)

ghostwood@sgw:~\$ dig ANY isc.org @172.20.1.1

# NANOG 69: DDoS Tutorial

10.1.1.10

191.236.103.221

S: 191.236.103.221 D: 3.3.3.3

## What is ANY isc.org

S: 3.3.3.3 D: 191.236.103.221

[illegible]

### 3.3.3.3

# On the wire

127.5.5.5	Attack	127.0.0.1	DNS	70	Standard query 0x4918	A test.com
127.5.5.5	traffic	127.0.0.1	DNS	70	Standard query 0x4918	A test.com
127.5.5.5		127.0.0.1	DNS	70	Standard query 0x4918	A test.com
127.5.5.5		127.0.0.1	DNS	70	Standard query 0x4918	A test.com
127.0.0.1	Reflector	127.5.5.5	DNS	153	Standard query response 0x4918	A 192.168.1.1
127.5.5.5	Target	127.0.0.1	ICMP	181	Destination unreachable (Port unreachable)	

- Victim is 127.5.5.5
- Attacker spoofs traffic as if it comes from 127.5.5.5
- Reflector (127.0.0.1) responds to the query to the victim
- BACK SCATTER  
Notice the victim is responding with port unreachable because there is nothing running on that UDP port. This is called back-scatter

# On the wire (details)

▼ Authoritative nameservers

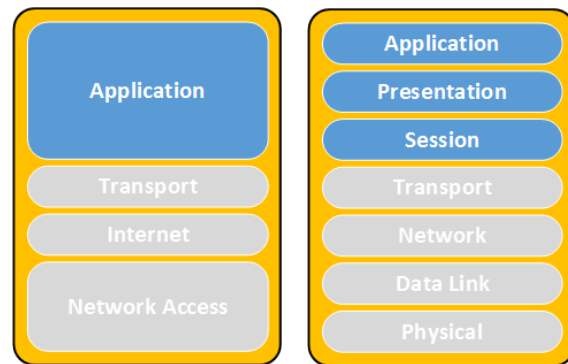

▶ test.com: type NS, class IN, ns localhost

▼ Additional records

▶ localhost: type A, class IN, addr 127.0.0.1

▶ localhost: type AAAA, class IN, addr ::1

- Reflector (127.0.0.1) responds to the query to the victim (127.5.5.5)
- Note the number of records in the answer

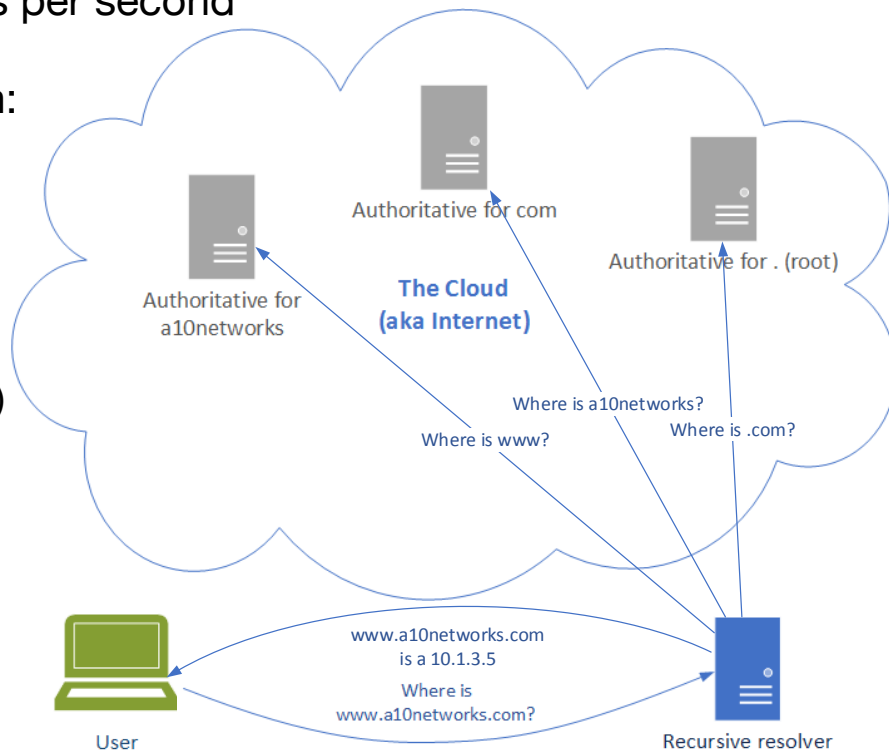

# Cache busting

---

# DNS resolution (rehash)

- Let's focus on the number of requests per second
- User talks to recursive resolver, which:
  - Caches answers
  - Answers a large number of requests
- The recursive talks to different level of authoritative servers, which:
  - Do not cache answers (they are auths)
  - Relatively lower number of queries
- Consider caching and authoritative capacity

# What is cache busting?

Attacker sends a query to recursive/reflector

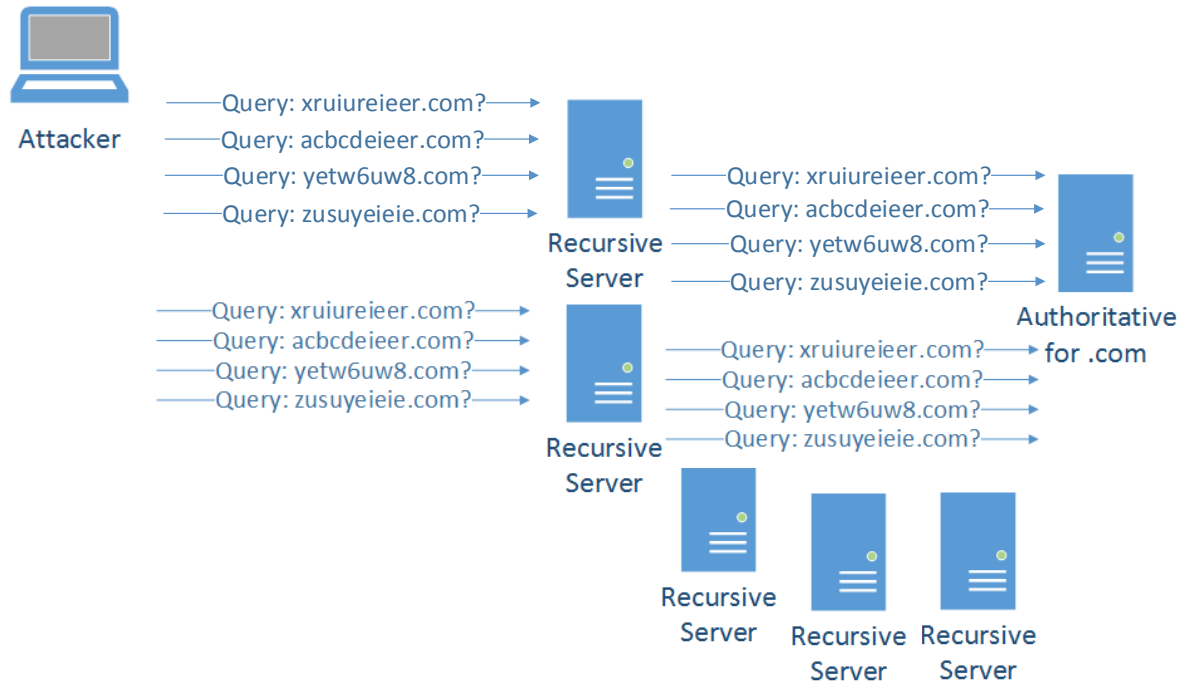

Recursive forwards the query

And so on...

Imagine one more

recursive resolver

Rinse and repeat...

# Questions?

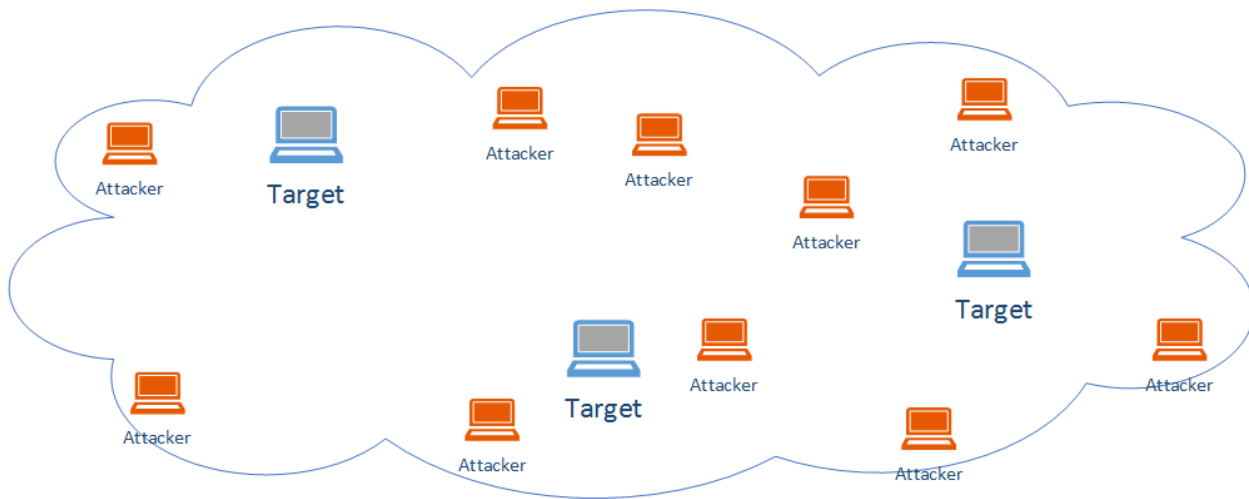

---

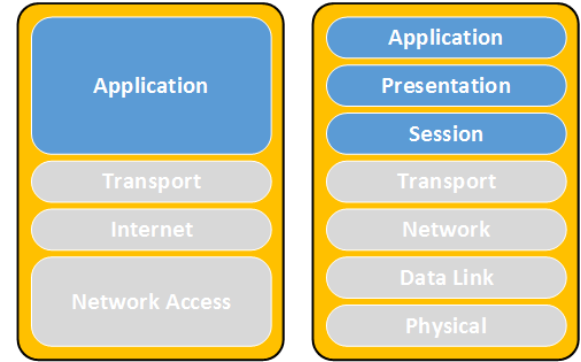

# Large scale mitigation and load distribution: Anycast

---

- Multiple points of presence advertise the same address space
- Network ensures user is routed to the “closest” instance

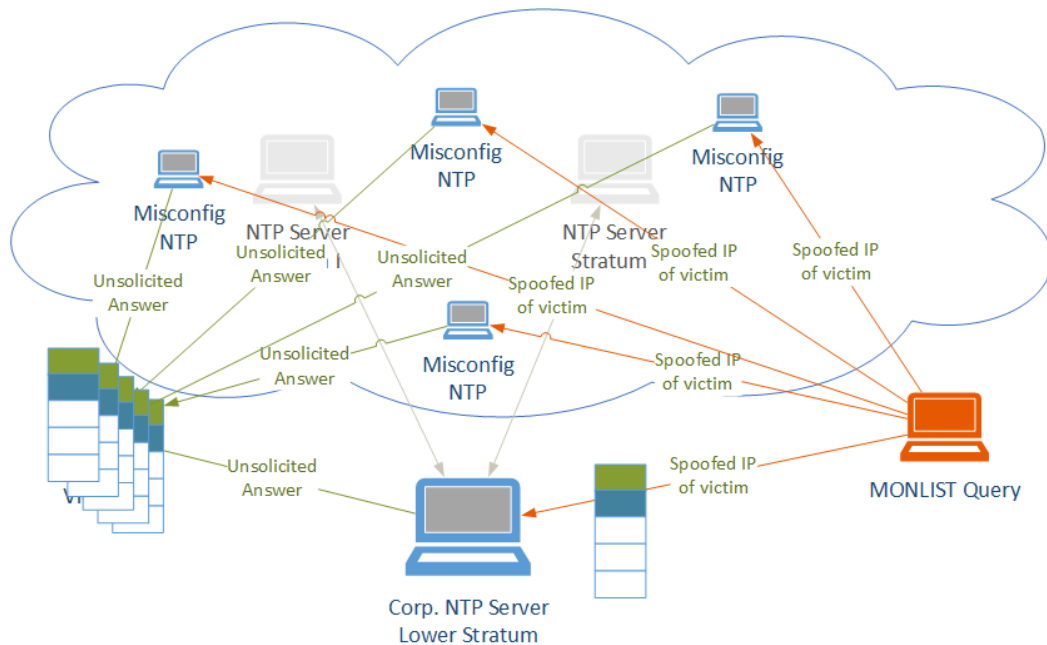

# Network Time Protocol (NTP)

---

# NTP reflection attack

- Stratum servers
- NTP queries
- MONLIST command
  - provides a list of clients that have time readings

# NTP server configuration

---

Access lists

NTP authentication

Disable the MONLIST command

Useful hints:

<http://www.team-cymru.org/secure-ntp-template.html>

List of open NTP reflectors:

<http://openntpproject.org/>

# Simple Network Management Protocol (SNMP)

---

# SNMP

---

- Different researchers claim amplification factors larger than the ones provided by NTP
- Tools floating in the wild
- Amplification 6 times according to US-CERT

# Simple Service Discovery Protocol (SSDP)

---

# SSDP

---

- Spoofed MSEARCH query with the source of the victim
- Amplification is up to 30 times (US-CERT)

# Reflection attacks summary and resources

---

- Summary
  - Protocols that allow spoofing of the source of a query
  - Protocols that provide amplification – the query is much smaller than the response
- SSDP: <http://openssdpproject.org/>
- DNS: <http://openresolverproject.org/>
- NTP: <http://openntpproject.org/>

# Questions?

---

# Thank you!

---

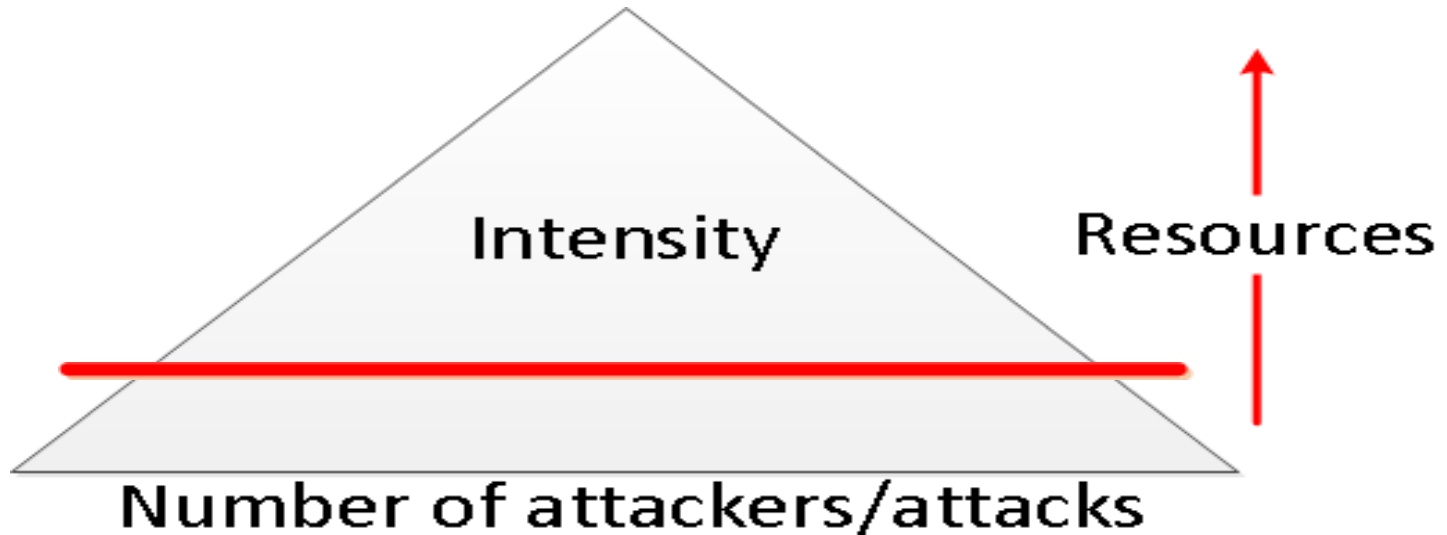

[krassi@fastly.com](mailto:krassi@fastly.com)

# Mitigation

---

# Risk Pyramid

---

# The cost of a minute?

---

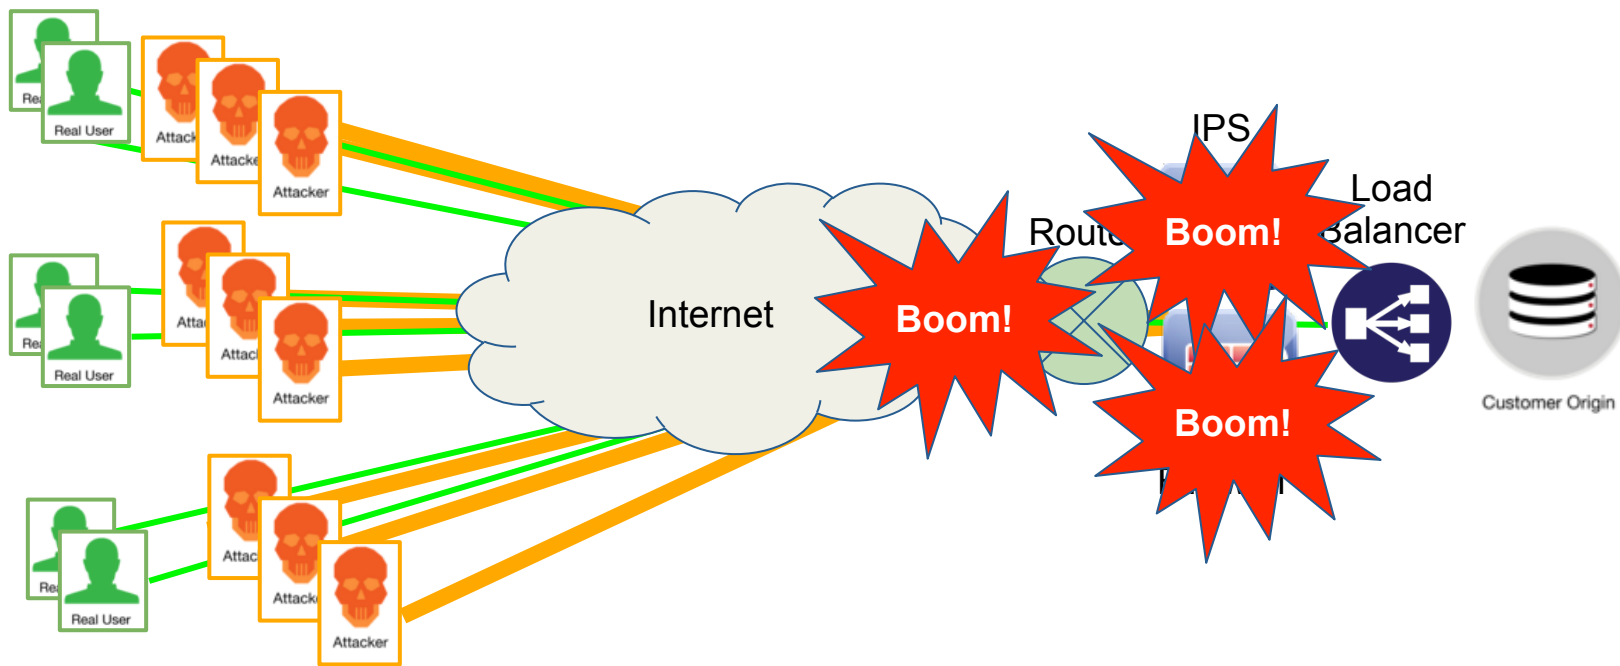

- How much does a minute of outage cost to your business?
- Are there other costs associated with it? Reputation?
- Are you in a risk category?
- How much is executive management willing to spend to stay up?
- Are there reasons you need to mitigate on-site vs offsite? Latency?

# On-site / DIY

---

- Bandwidth
- Equipment
- Qualified personnel
- More expensive overall but cheaper per MB
- Need for a backup plan

# On Premise DDoS Mitigation

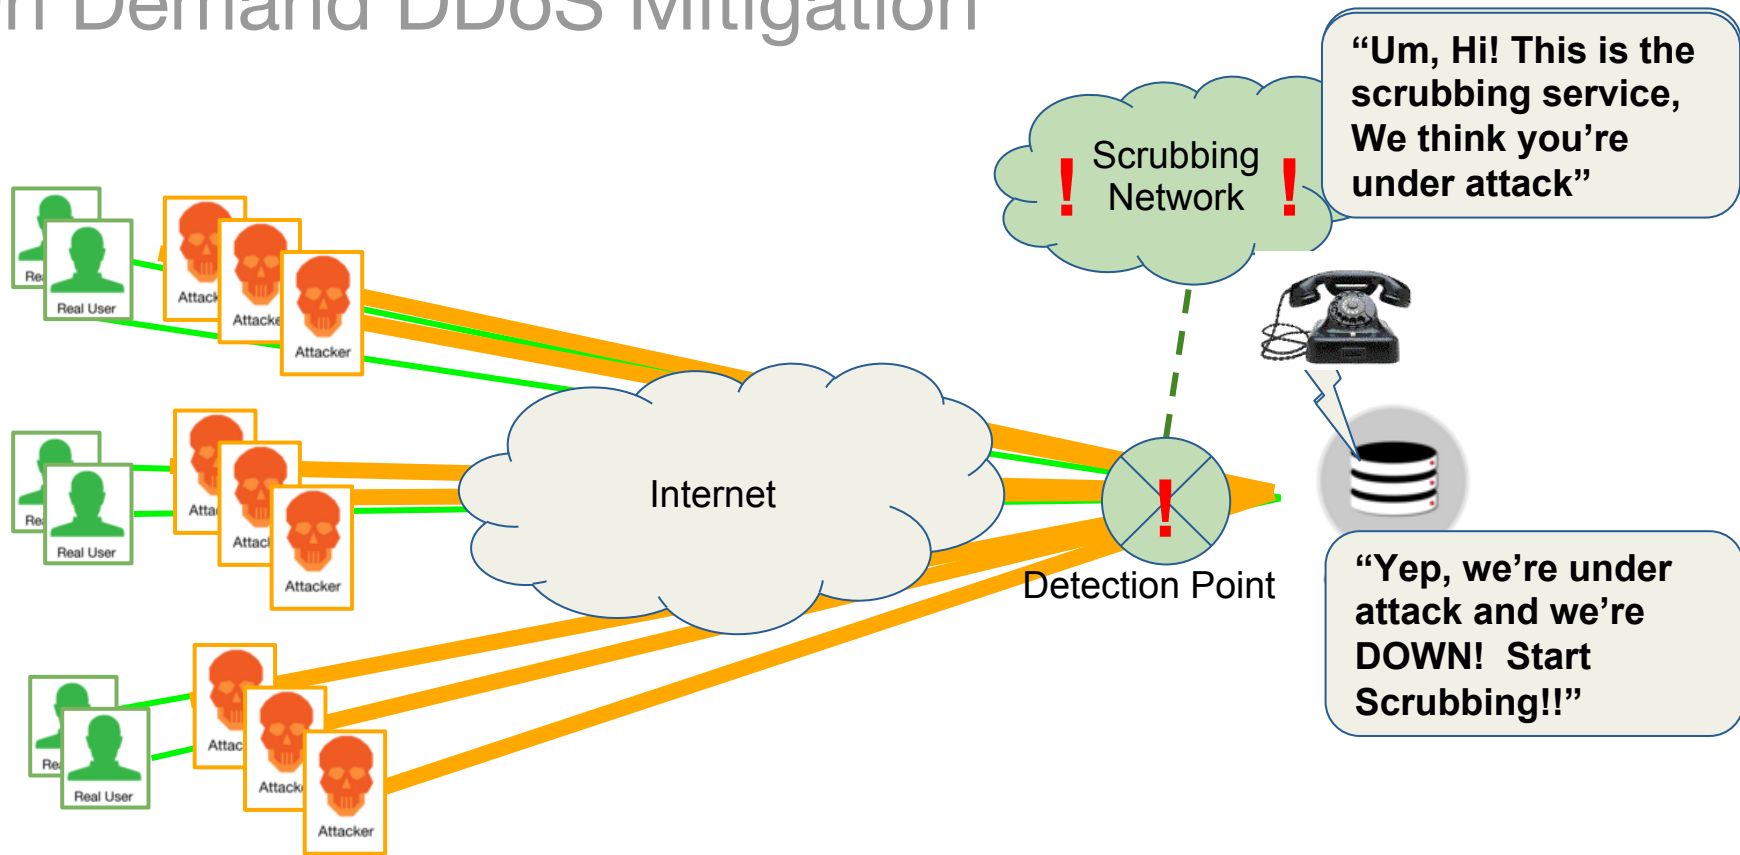

# Outsource / scrubbing center

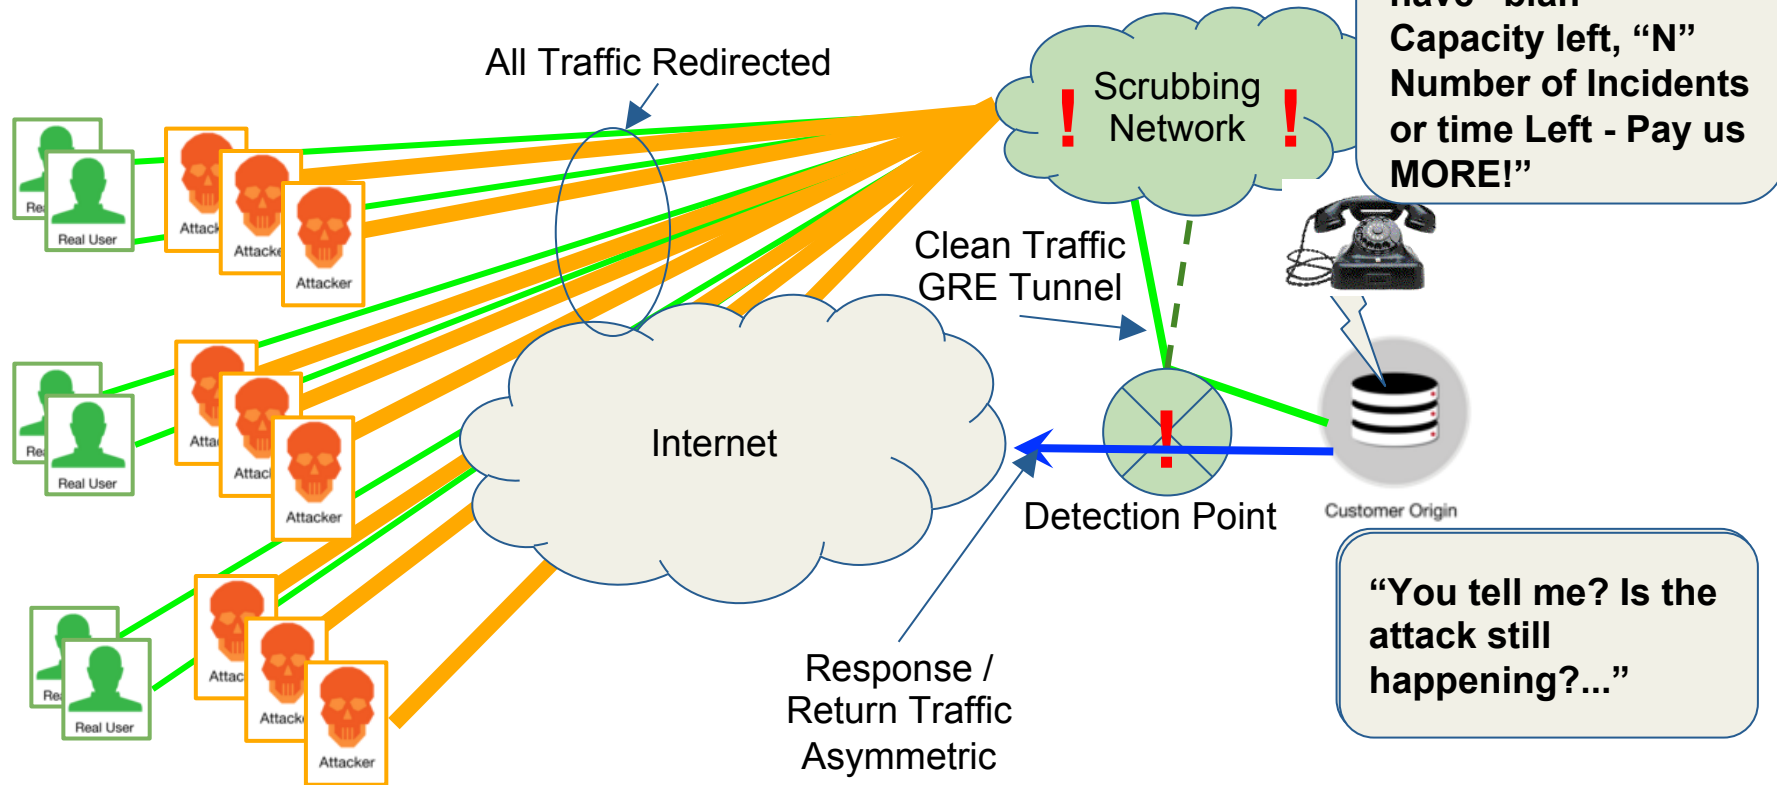

---

- Limited protocol support (usually HTTP/S)
- Added latency
- May lose visibility to source IP of the client
- Pay per MB of clean traffic (usually)
- Fast setup/Lower overhead
- More expensive per MB

# On Demand DDoS Mitigation

# On Demand DDoS Mitigation

# Always On DDoS Mitigation

# Questions?

---

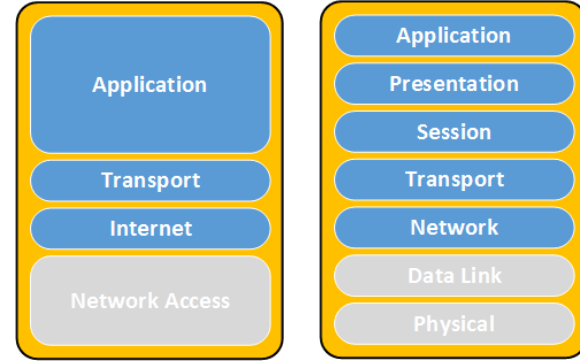

# Thank you!

---

[krassi@fastly.com](mailto:krassi@fastly.com)

# Good Internet citizenship

---

# Mitigations

---

- Defend yourself
  - Anycast
  - Some form of IPS/DDoS mitigation gear
  - Overall network architecture
- Defend the Internet
  - Rate-limiting
  - BCP38/140 (outbound filtering) source address validation
  - Securely configured DNS, NTP and SNMP servers
  - No open resolvers
- Talk to the professionals

# Are you noticing the imbalance?

---

## •Defend yourself

Anycast (DNS)

Some form of IPS/DDoS mitigation gear

- **Lots of money**

## Defend the Internet

Rate-limiting

BCP38/140 (outbound filtering) source address validation

Securely configured authoritative DNS servers

No open resolvers

- **Somewhat cheap**

# What's the point I'm trying to make?

---

- It's not feasible to mitigate those attacks single handedly
- We need cooperation
- Companies need to start including “defending the Internet from themselves” as a part of their budget – not only “defending themselves from the Internet”

## What can I do about it?

- RFC 2827/BCP 38 – Paul Ferguson
- If possible filter all outgoing traffic and use proxy
- uRPF
  
- BCP 140: “Preventing Use of Recursive Nameservers in Reflector Attacks”
- <http://tools.ietf.org/html/bcp140>
- Aka RFC 5358

# Resources

---

- DNS

<http://openresolverproject.org/>

- NTP

<http://openntpproject.org/>

- If you see your IP space in the lists provided by those sites – resolve it

# Summary

---

- Discuss what DDoS is, general concepts, adversaries, etc.
- Went through a networking technology overview, in particular the OSI layers, sockets and their states, tools to inquire system state or capture and review network traffic
- Dove into specifics what attack surface the different layers offer
- Discussed different attack types
- Terminology
- Tools

# Thank you!

---
